

EE 6886: Topics in Signal Processing -- Multimedia Security System

Lecture 12: VoIP Security

Ching-Yung Lin
Department of Electrical Engineering
Columbia University, New York, NY 10027

Course Outline

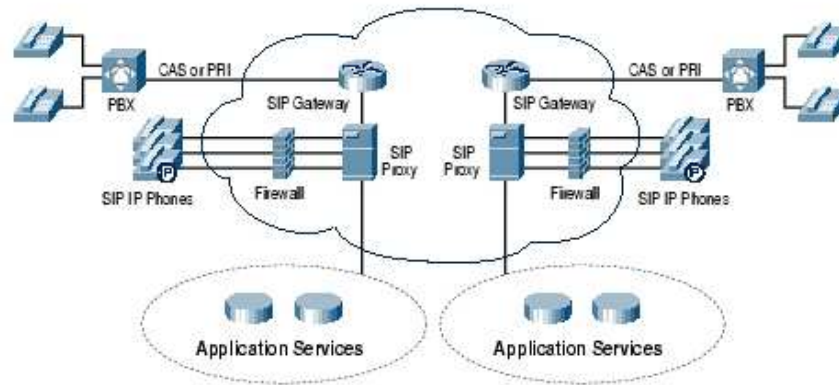

▣ Multimedia Security :

- Multimedia Standards – Ubiquitous MM
- Encryption and Key Management – Confidential MM
- Watermarking – Uninfringible MM
- Authentication – Trustworthy MM

▣ Security Applications of Multimedia:

- Audio-Visual Person Identification – Access Control, Identifying Suspects
- Media Application Networks – VoIP
- Surveillance Understanding

Voice over IP

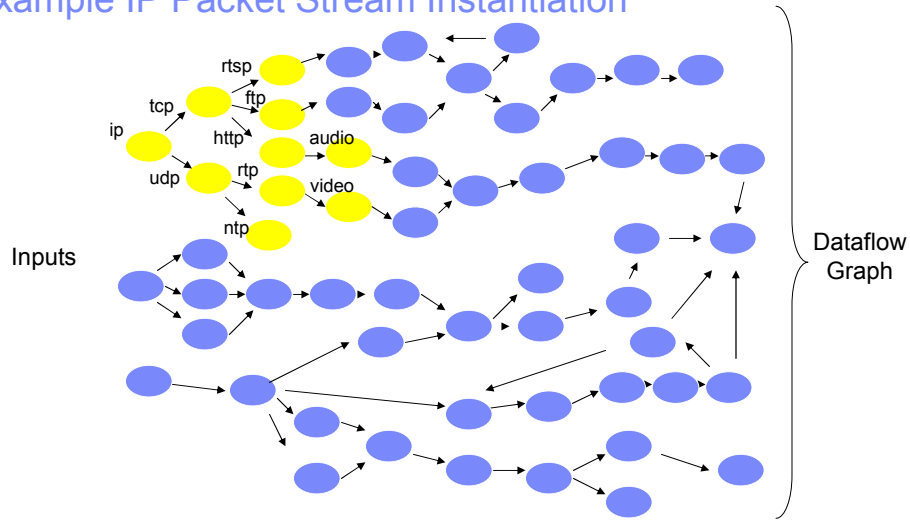

Transporting voice or video over an IP based network

□ Layered Model – a packet is consisted of:

- Internet Protocol (IP)
- User Datagram Protocol (UDP)
- Real-Time Transport Protocol (RTP)
- RTP Payload

Example IP Packet Stream Instantiation

By IBM Dense Information Gliding Team

IP – Internet Protocol

- ❑ IP is responsible for the delivery of packets between host computers.
- ❑ Connectionless protocol:
 - no guarantees concerning:
 - reliability
 - flow control
 - error detection or error correction
- ❑ Any VoIP transmission must use IP.

	0	1	2	3	4	5	6	7	8	9	10	11	12	13	14	15	16	17	18	19	20	21	22	23	24	25	26	27	28	29	30	31

1 - 4	Version		IHL		Type of service				Total length																							
5 - 8	Identification								Flags		Fragment offset																					
9 - 12	Time to live				Protocol				Header checksum																							
13 - 16	Source address																															
17 - 20	Destination address																															

UDP – User Datagram Protocol

- ❑ In general, two protocols available at the transport layer: TCP and UDP.
- ❑ TCP – connection oriented protocol:
 - establish a communications path prior to transmitting data.
 - handles sequencing and error detection.
- ❑ UDP – connectionless protocol:
 - routes data to its correct destination port.
 - not attempt to perform any sequencing or to ensure data reliability.

	0	1	2	3	4	5	6	7	8	9	10	11	12	13	14	15	16	17	18	19	20	21	22	23	24	25	26	27	28	29	30	31
	Octet 1,5				Octet 2,6				Octet 3,7				Octet 4,8																			
1 - 4	Source port								Destination port																							
5 - 8	Length								Checksum																							

RTP – Real-Time Transport Protocol

- ❑ Real time applications require mechanisms to ensure a stream of data can be reconstructed accurately.
- ❑ Jitter is the variation in delay times experienced by the individual packets.
- ❑ To reduce the effects of jitter, data must be buffered at the receiving end of the link so that it can be played out at a constant rate.

	0	1	2	3	4	5	6	7	8	9	10	11	12	13	14	15	16	17	18	19	20	21	22	23	24	25	26	27	28	29	30	31
	Octet 1,5,9				Octet 2,6,10				Octet 3,7,11				Octet 4,8,12																			
1 - 4	V=2	P	X	CC	M	PT	Sequence number																									
5 - 8	Timestamp																															
9 - 12	Synchronisation source (SSRC) number																															

Complete Header and Payload

- ❑ The length of payload can vary.
- ❑ For voice, samples representing 20ms are considered the maximum duration for the payload.
- ❑ Payload duration is a trade-off between bandwidth requirements and quality.

	0	1	2	3	4	5	6	7	8	9	10	11	12	13	14	15	16	17	18	19	20	21	22	23	24	25	26	27	28	29	30	31
	Octet 1,5,9...				Octet 2,6,10...				Octet 3,7,11...				Octet 4,8,12...																			
1 - 4	Version		IHL		Type of service				Total length																							
5 - 8	Identification								Flags		Fragment offset																					
9 - 12	Time to live				Protocol				Header checksum																							
13 - 16	Source address																															
17 - 20	Destination address																															
21 - 24	Source port								Destination port																							
25 - 28	Length								Checksum																							
29 - 32	V=2	P	X	CC	M	PT	Sequence number																									
33 - 36	Timestamp																															
37 - 40	Synchronisation source (SSRC) number																															

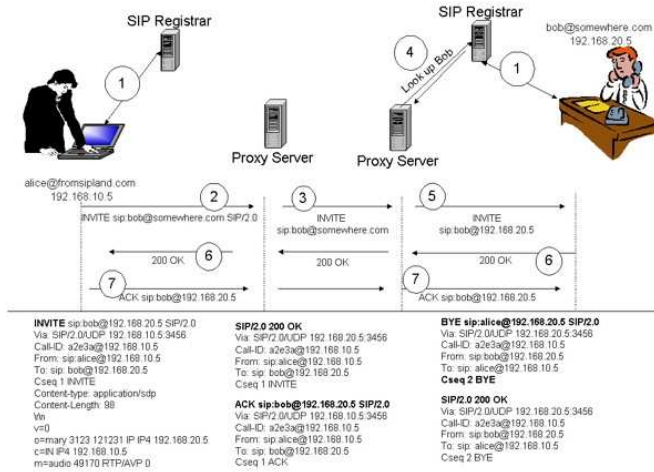

The headers are followed by a payload of digitised voice or video samples

Packet Analysis

- ❑ Sniffer can be used to analyze packets.
- ❑ Demo: Video Streaming and Ethereal Network Analyzer

SIP Protocols

Session Initiation Protocol (SIP)

Network Security Issues and Solutions

- ❑ Denial-of-Service (DoS) Attacks
- ❑ Eavesdropping
- ❑ Packet Spoofing
- ❑ Replay
- ❑ Message Integrity

Denial-of-Service (DoS) Attacks

Method:

- Prevention of access of a network service by mombaring SIP proxy servers or voice-gateway devices on the Internet with inauthentic packets

Possible Solution:

- Configure devices to prevent such attacks

Registration Hijacking

Registration Request

Frame 1 (611 bytes on wire, 611 bytes captured)

Ethernet II, Src: 00:12:17:e5:7e:00, Dst: 00:05:00:e5:5b:00

Internet Protocol, Src Addr: 192.168.10.5 (192.168.10.5), Dst Addr: 192.168.10.2 (192.168.10.2)

Content-Length: 0

Allow: ACK, BYE, CANCEL, INFO, INVITE, NOTIFY, OPTIONS, REFER

Supported: Texture

Request to REGISTER and announce contact address for the user. In the REGISTER request the From and To headers must use the same user information.

Indicates that the registration will expire in 60 seconds. Another REGISTER Request should be sent to refresh the user's registration.

The Contact header contains a SIP or SIPS URI that represents a direct route to the device, usually composed of a username at a fully qualified domain name (FQDN).

Modified IP address in the Contact header will force incoming calls to be diverted to the attacker's device.

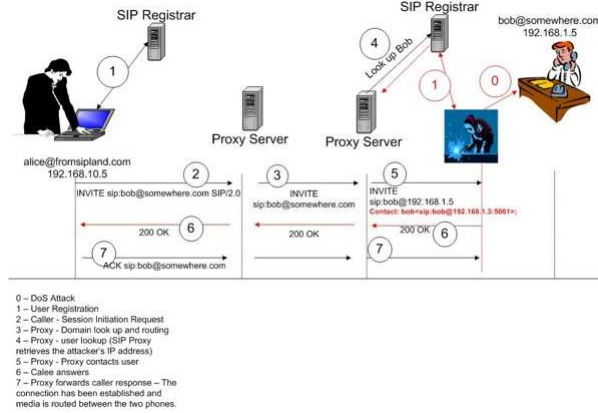

Hijacking Attack

Disable the legitimate user's registration:

- Performing a Denial-of-Service attack against the user's device:
 - deregistering the user
 - generating a registration race-condition in which the attacker sends repeatedly REGISTER requests in a shorter timeframe in order to override the legitimate user's registration request.
- Send a REGISTER request with the attacker's IP address instead of the legitimate user's IP.

Hijacking Attack

- Attack is possible for the following reasons:
 - The signaling messages are sent in the clear form.
 - The current implementation of the SIP Signaling messages do not support integrity of the message content.

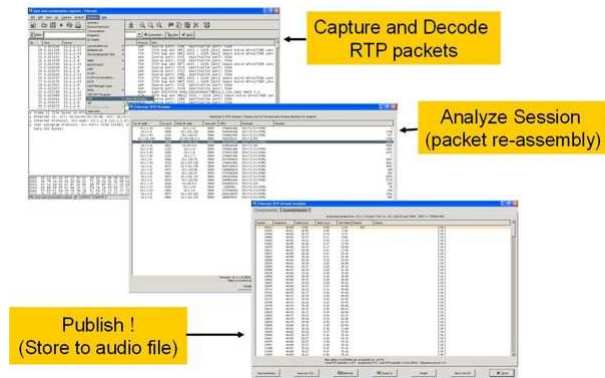

Eavesdropping

- Method:
 - Unauthorized interception of voice packets or Real-Time Transport Protocol (RTP) media stream.
 - Decoding of signaling messages.
- Possible Solution:
 - Encrypt transmitted data (e.g., Secure RTP)
 - Encrypt signaling messages

Eavesdropping

- Steps to capture and decode voice packets

Eavesdropping in 3 easy Steps !

Packet Spooling

- Method:
 - Impersonation of a legitimate user transmitting data.
- Possible Solution:
 - “Send address” authentication (e.g., endpoint IP addresses) between call participants.

Man-in-the-middle attack

❑ Spoofing

Replay

❑ Method:

- Retransmission of a genuine message so that the device receiving the message reprocesses it.

❑ Possible Solutions:

- Encrypt and sequence messages.
- In SIP, this is offered at the application-protocol level by using CSeq and Call-ID headers.

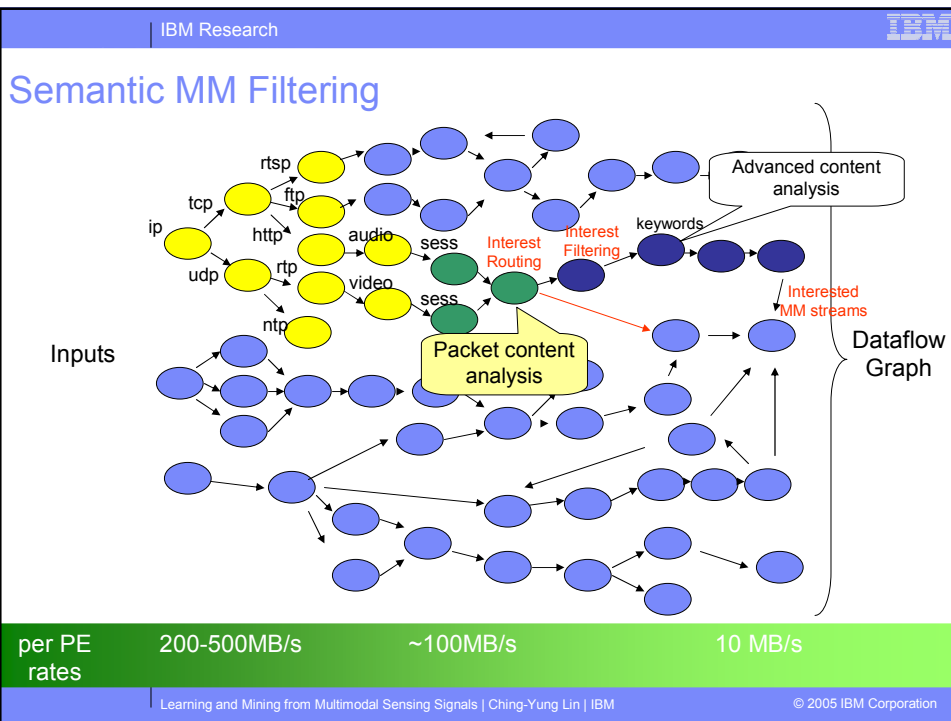

Message Integrity

Method:

- Ensuring that the message received is the same as the message that was sent.

Possible Solutions:

- Authenticate messages by using HTTP Digest – an option supported by some SIP-enabled phones and SIP Proxy server.

IBM Research

Resource-Accuracy Trade-Offs

The diagram illustrates the process of resource-accuracy trade-offs. It starts with input data X (represented by a network of green nodes) which is processed to yield relevant information $Y(X|q)$. This information is then filtered based on a resource R to produce an achievable subset X' (represented by a network of orange nodes). Finally, X' is processed to yield relevant information $Y''(X|q,R)$.

- **Input data X – Queries q – Resource R**
 - $Y(X|q)$: Relevant information
 - $Y'(X|q, R) \in Y(X|q)$: Achievable subset given R
- **Configurable Parameters of Processing Elements to maximize relevant information:**
 - $Y''(X|q, R) > Y'(X|q, R)$,
with resource constraint.
- **Required resource-efficient algorithms for:**
 - Classification, routing and filtering of signal-oriented data: (audio, video and, possibly, sensor data)

IBM Research

Distributed Video Signal Understanding

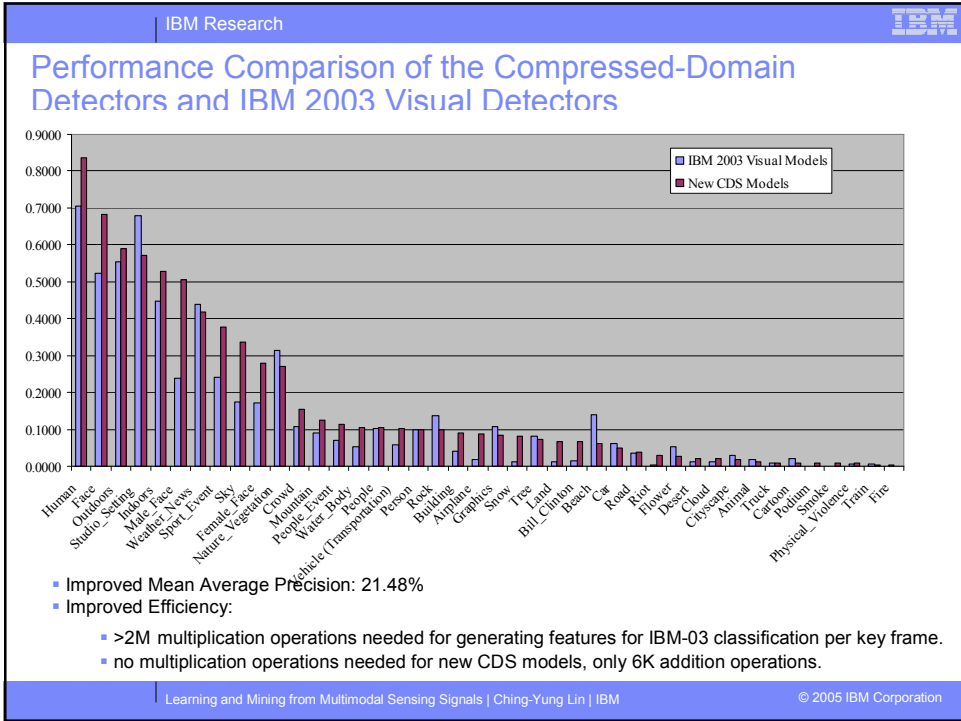

The diagram shows a distributed video signal understanding system. It starts with input from various sources: TV broadcast, VCR, DVD discs, Video File Database, Webcam, and Smart Cam. These inputs go through an encoding stage (MPEG-1/2, 1.5 Mbps) to produce GOPs (320 Kbps). These are then processed by Feature Extraction (22.4 Kbps) and Event Extraction (2.8 Kbps) to produce CDS Features. These features are sent to (Server) Concept Detection Processing Elements (PE1-PE100), which output Meta-data (600 bps). The system also includes Sensor 1, Sensor 2, Sensor 3, and Sensor N. User Interests and Resource Constraints are used to control the system, which is managed by Control Modules. The system also includes Display and Information Aggregation Modules.

(Server) Concept Detection Processing Elements

Demo -- Novel Semantic Concept Filters

- <http://www.research.ibm.com/VideoDIG>
- E.g.:

The screenshot shows a web browser window titled 'IBM ESPS Multimedia Semantic Routing - Microsoft Internet Explorer'. The address bar shows a URL from alshan.watson.ibm.com. The main content area displays 'Exploratory Stream Processing Systems' and 'ESPS Multimedia Semantic Classifiers'. Under the heading 'Basketball', there are six video thumbnails arranged in a 2x3 grid. Each thumbnail shows a basketball game in progress. Below each thumbnail, there is a small box containing classification information, including a video ID (e.g., 19980417_CNN_040181_040188_040254), a score (e.g., 83-84), and a time stamp (e.g., 0:00 20:30).

Complexity Reduction Introduction

- **Objective: Real-time classification of instances using Support Vector Machines (SVMs)**
- **Computationally efficient and reasonably accurate solutions**
- **Techniques capable of adjusting tradeoff between accuracy and speed based on available computational resources**

SVM formulation

- **Given :**
 - Training instances $\{x_i\}$ with labels y_i
- **Objective :**
 - Find maximum margin hyperplane separating positive and negative training instances

Decision

- **Score of unseen instance** $u_j : w \cdot \phi(u_j)$
- **In terms of Lagrangian multipliers**

$$\sum_i \alpha_i y_i k(x_i, u_j)$$

- **Computational Cost : $O(n_{sv}d)$**
 - n_{sv} : Number of support vectors
 - d : Dimensionality of each data instance

Problems

- **Number of support vectors grows quasi-linearly with size of training set [Tipping 2000]**
- **Inner product with each support vector of dimensionality d expensive**
 - Example TREC2003
 - Human : 19745 support vectors
 - Face : 18090
- **High data rates(10Gbits/sec) means large number of abandoned data**

Example

- **Processing Power 1 Ghz**
- **10000 support vectors**
- **1000 / 2 features per instance**
- **Order of at least 10^7 operations required per stream per sec**
- **Translates to less than 100 instances evaluated per sec with only one classifier**

Naïve Approach I – Feature Dimension Reduction

- Experimental Results for Weather_News Detector
- Model Selection based on the Model Validation Set
- E.g., for Feature Dimension Ratio 0.22, (the best selection of features are: 3 slices, 1 color, 2 texture selections), the accuracy is decreased by 17%.

Slice	Color	Texture	Feature Dimension Ratio	AP
3	3	3	1	0.7861
3	3	2	0.6666666667	0.7861
3	2	3	0.6666666667	0.7757
2	3	3	0.6666666667	0.5822
3	2	2	0.4444444444	0.7757
2	3	2	0.4444444444	0.5822
2	2	3	0.4444444444	0.5235
3	3	1	0.3333333333	0.4685
3	1	3	0.3333333333	0.6581
1	3	3	0.3333333333	0.1684
2	2	2	0.296296296	0.5235
3	2	1	0.2222222222	0.427
3	1	2	0.2222222222	0.6581
2	3	1	0.2222222222	0.1241
2	1	3	0.2222222222	0.3457
1	3	2	0.2222222222	0.1684
1	2	3	0.2222222222	0.1065
2	2	1	0.148148148	0.0699
2	1	2	0.148148148	0.3457
1	2	2	0.148148148	0.1065
3	1	1	0.1111111111	0.3219
1	3	1	0.1111111111	0.0314
1	1	3	0.1111111111	0.07
2	1	1	0.074074074	0.0318
1	2	1	0.074074074	0.0173
1	1	2	0.074074074	0.07
1	1	1	0.037037037	0.0123

Naïve Approach II – Reduction on the Number of Support Vectors

- Proposed Novel Reduction Methods:
 - **Ranked Weighting**
 - **P/N Cost Reduction**
 - **Random Selection**
 - **Support Vector Clustering and Centralization**
- Experimental Results on Weather_News Detectors show that complexity can be at 50% for the cost of 14% decrease on accuracy

Weighted Clustering Approach

- **Basic steps**
 - Cluster support vectors
 - Use cluster center as representative for all support vectors in cluster
 - Determine scalar weight associated with each cluster center
 - Use only cluster centers to score new instances

Cluster center weight (contd.)

- Choose γ_i minimizing square of difference in scores over all \pm_i and d
- Sub-cases :

$$d \geq \Delta_i$$

$$d < \Delta_i$$

Using the weights

- For every support vector in cluster
 - Distance Δ_i known
 - Two weights computed
- Cumulative effect of all support vectors in clusters additive
 - Δ_i because of various support vectors added up at center to simulate effect of all support vectors
- Δ_i sorted, weight arrays rearranged

Experiments

□ Datasets

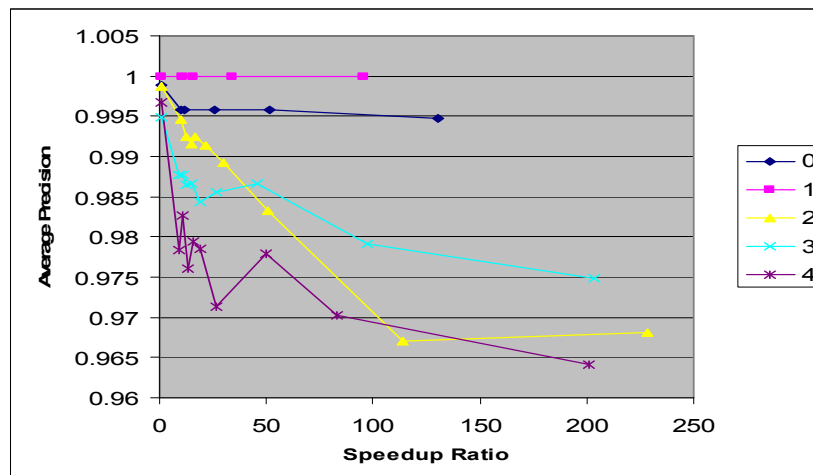

- TREC video datasets (2003 and 2005)
 - 576 features per instance
 - > 20000 test instances overall
- MNist handwritten digit dataset (RBF kernel)
 - 576 features
 - 60000 training instances, 10000 test instances

□ Performance metrics

- Speedup achieved over evaluation with all support vectors
- Average precision achieved

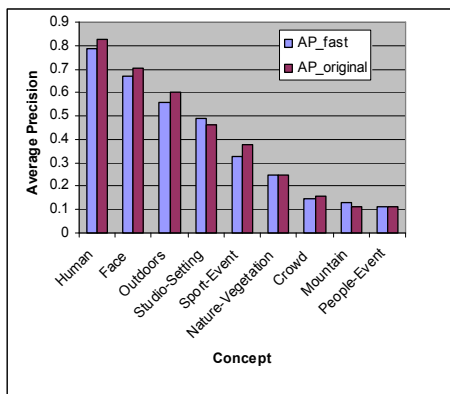

Results (Mnist 0-4)

Results (Mnist 5-9)

Results (TREC 2003)

Summary of Complexity Reduction

- ❑ Techniques presented demonstrate reasonable performance in terms of both speedup and average precision over multiple concepts in datasets
- ❑ Speedups
 - MNist : All concepts at least 50 times faster with AP within 0.04 of original
 - TREC 2003: Eight out of nine concepts speedup greater than 80 times with AP within 0.05 of original
 - TREC 2005: APs in some cases along with speedup respectable
- ❑ APs of most concepts close to original APs
