# Live Sports Video Filtering and Navigation

Linear/Passive Video

Interactive Video

- Highlights
- Pitches
- Runs
- By Player
- By Time
- Set your Own
- Save
- Delete
- Edit

- Time sensitive interest
- Massive production and audience
- Time compressibility
- Temporal structure and production rules

# Beyond Ringer and Clip Download

## Services:

- Messaging
- Localized information
- Media/game download
- Multi-person games
- TV phone
- On-site purchase

Time-sensitive short video messages suiting personal needs

# Regular Structure and Views in Sports Video

# Regular set of views

Pitching

Close-up pitcher

Catcher

Base hit

First base

Full field

- Important issues:  
canonical view  $\leftrightarrow$  beginning of event  
view transition pattern  $\leftrightarrow$  types of events

# Prior work

- **Basketball: Saur, Tan *et al* '97**
  - Use camera motion to detect events (wide angle, close up, fast break)
- **Tennis: Sudhir *et al*, '98**
  - Detect play events (rally, net play *etc*) by detecting the court lines and players
- **Soccer: Gong *et al* '95**
  - Classify location and event by detecting lines, motion, and players
- **Baseball: Rui *et al*, '00**
  - Detecting highlight from audio track
- **Sports Recurrent Semantic Event Extraction**
  - Zhong/Chang '01: Pitching, Serving, *etc*
  - Xie/Chang '01: play/break in soccer

# Review of RSU Extraction

- Framework for automatic structure parsing (canonical view detection)
- Real-time processing → simple features and compressed-domain
- Combine learning tools and systematic rule acquisition
- Combine frame-level and object-level analysis

# System for “serve” view detection

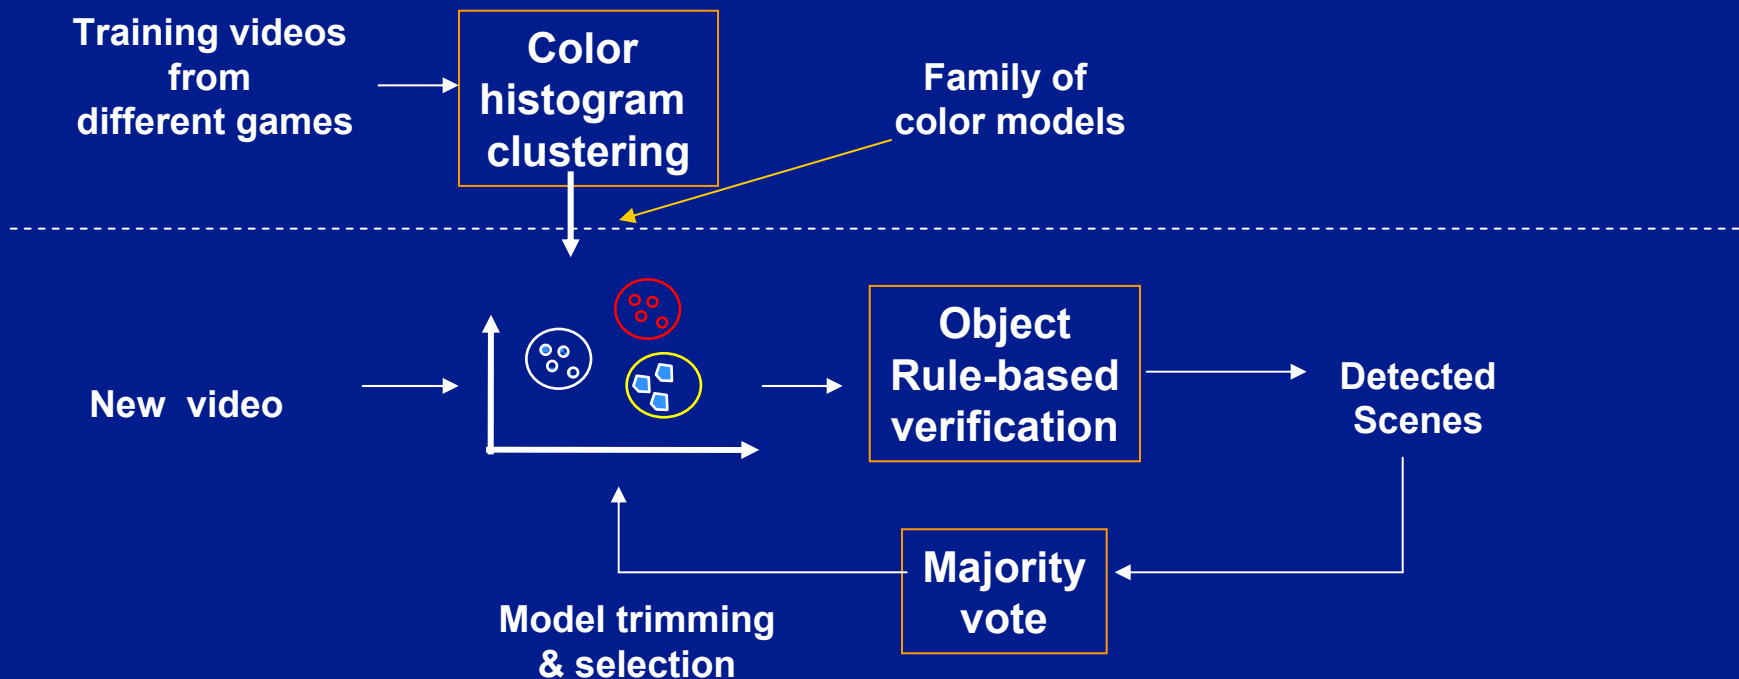

Color,  
lines,  
player

# Adaptive color filtering

- Improve robustness over source variations
- Improve speed

# Object rule verification

## Segmentation based verification

For each key frame in a shot

- automatic region segmentation based on color, edge, and motion projection
- detect court region based on color consistency, size, and location
- region tracking and background layer modeling to detect moving objects
- verify the size and position of court and player

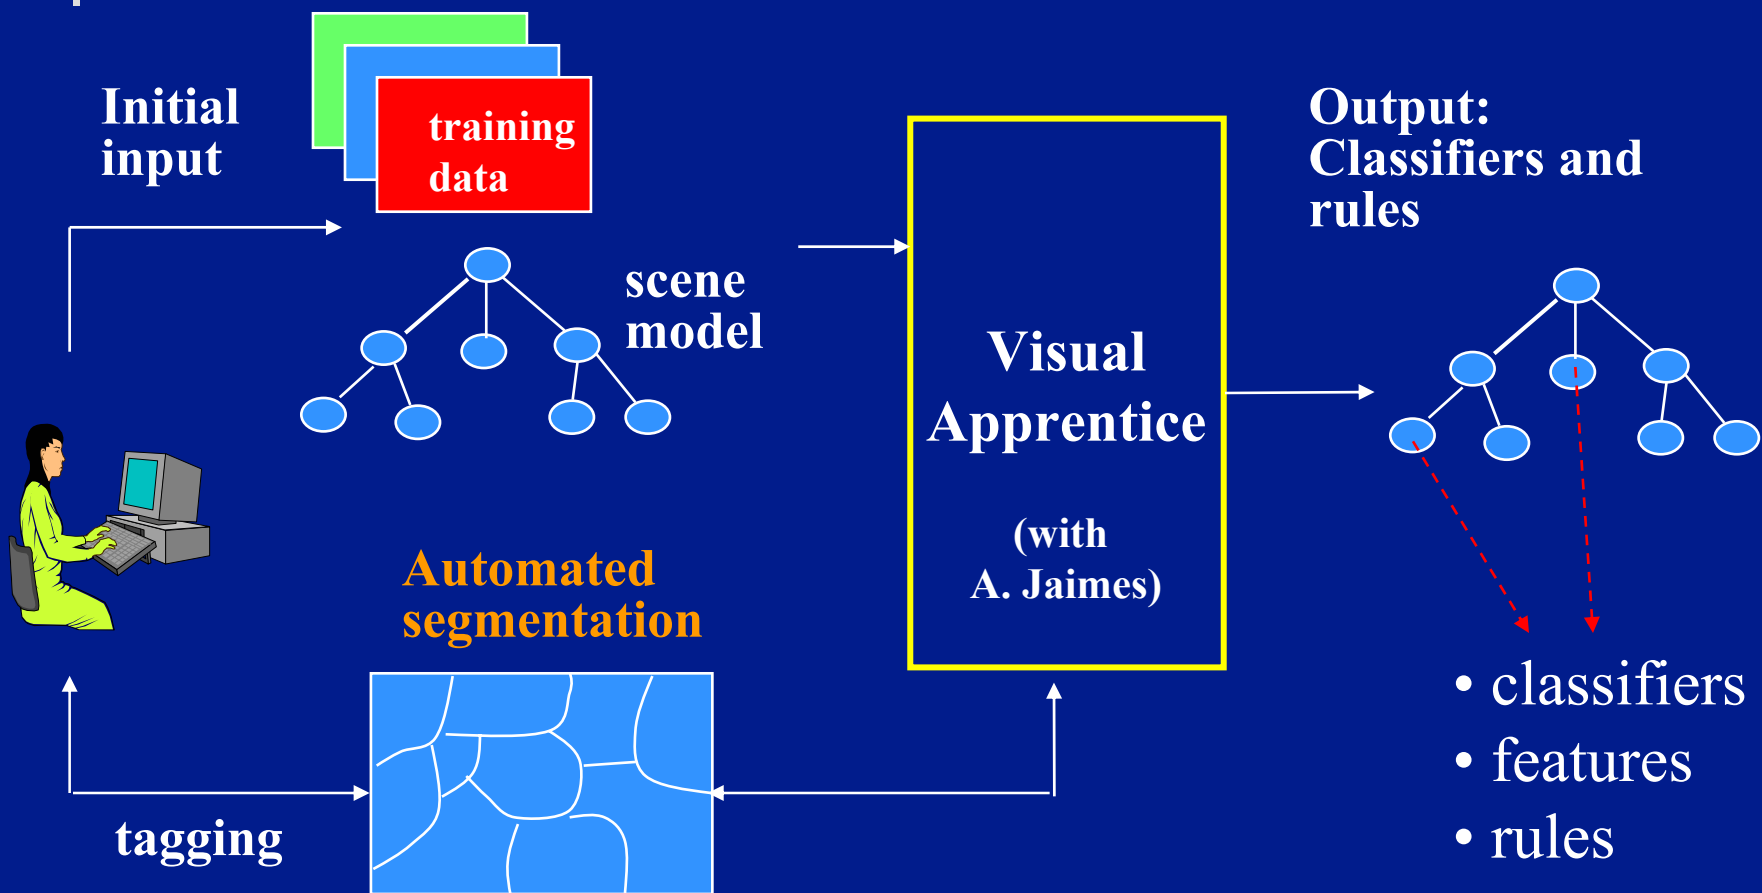

# Object-level rules

## Edge based Verification

- Using Hough transform to detect court lines within the court field
- Verify number of horizontal and vertical court lines
- Verify the locations of the lines

# Systematic learning of object rules

# Extension to other types: learning new rules

Level 1: Object

Pitching

Level 2: Object-part

Ground

Pitcher

Batter

Level 3: Perceptual Area

Grass

Sand

Level 4: Region

Regions

Regions

Regions

Regions

# Experiment results

**Training data – 3-4 different games (10 mins each)**

**Testing data – 1 hour tennis and 1 hour baseball**

|                         | <b>Ground truth</b> | <b># of Hits</b> | <b># of False</b> |
|-------------------------|---------------------|------------------|-------------------|
| <b>Tennis (Serve)</b>   | <b>89</b>           | <b>82 (92%)</b>  | <b>2</b>          |
| <b>Baseball (Pitch)</b> | <b>93</b>           | <b>90 (97%)</b>  | <b>4</b>          |

**Case 1: initial segment of testing data  
included in training set**

# Experiment Results – cont.

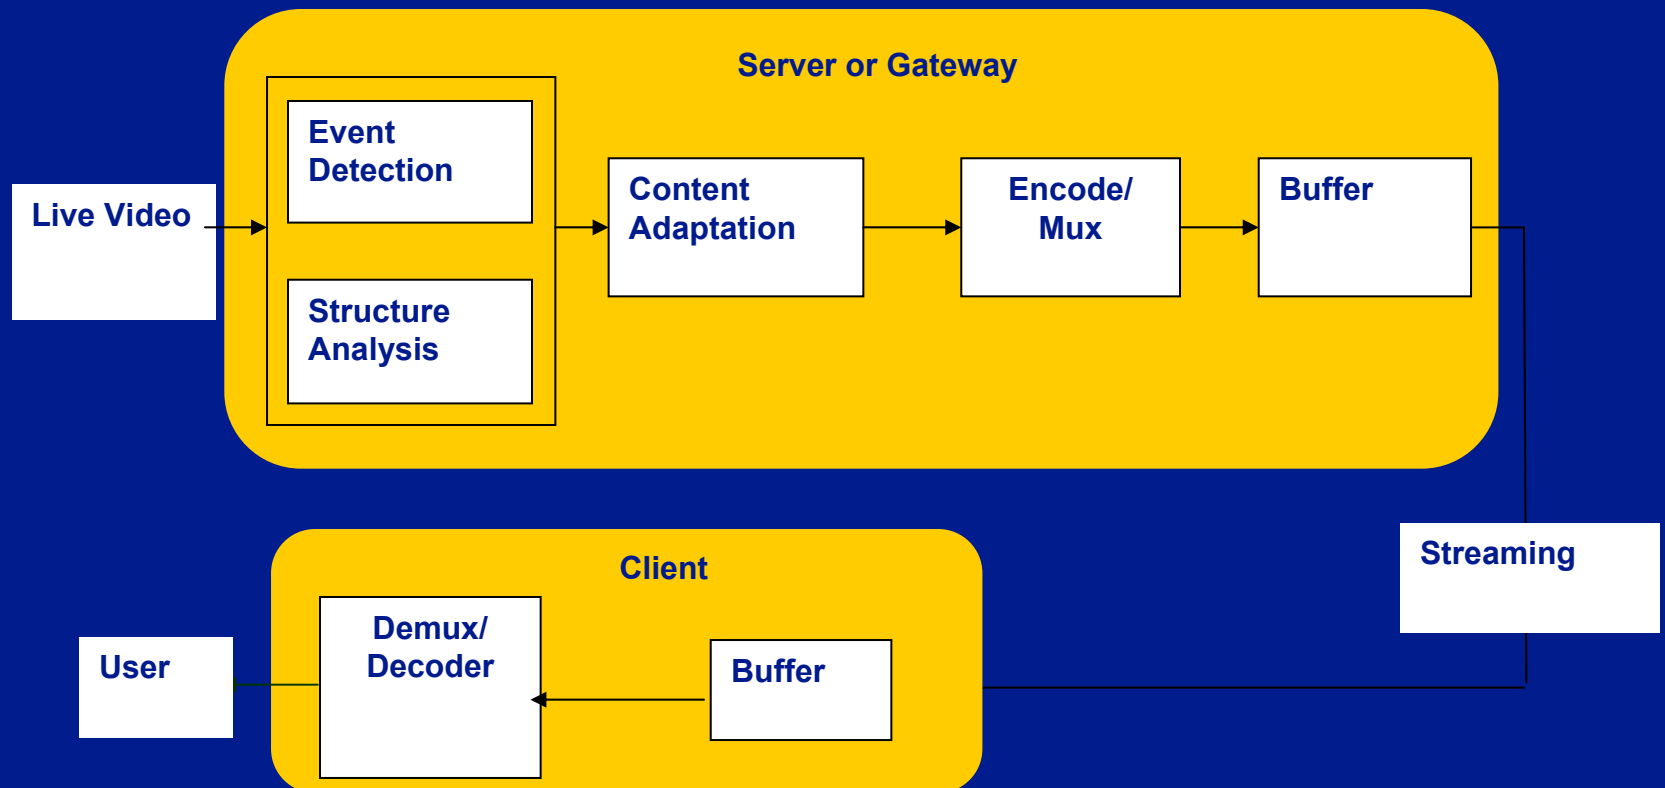

Case 2: initial segment of testing data  
excluded from training set

|                         | <b>Ground truth</b> | <b># of Hit</b> | <b># of False</b> |
|-------------------------|---------------------|-----------------|-------------------|
| <b>Tennis (Serve)</b>   | <b>74</b>           | <b>68 (92%)</b> | <b>1</b>          |
| <b>Baseball (Pitch)</b> | <b>57</b>           | <b>56 (98%)</b> | <b>5</b>          |

- **Key factors:**
  - **Comprehensive color models + adaptive selection**
  - **Error correction by object-level verification**

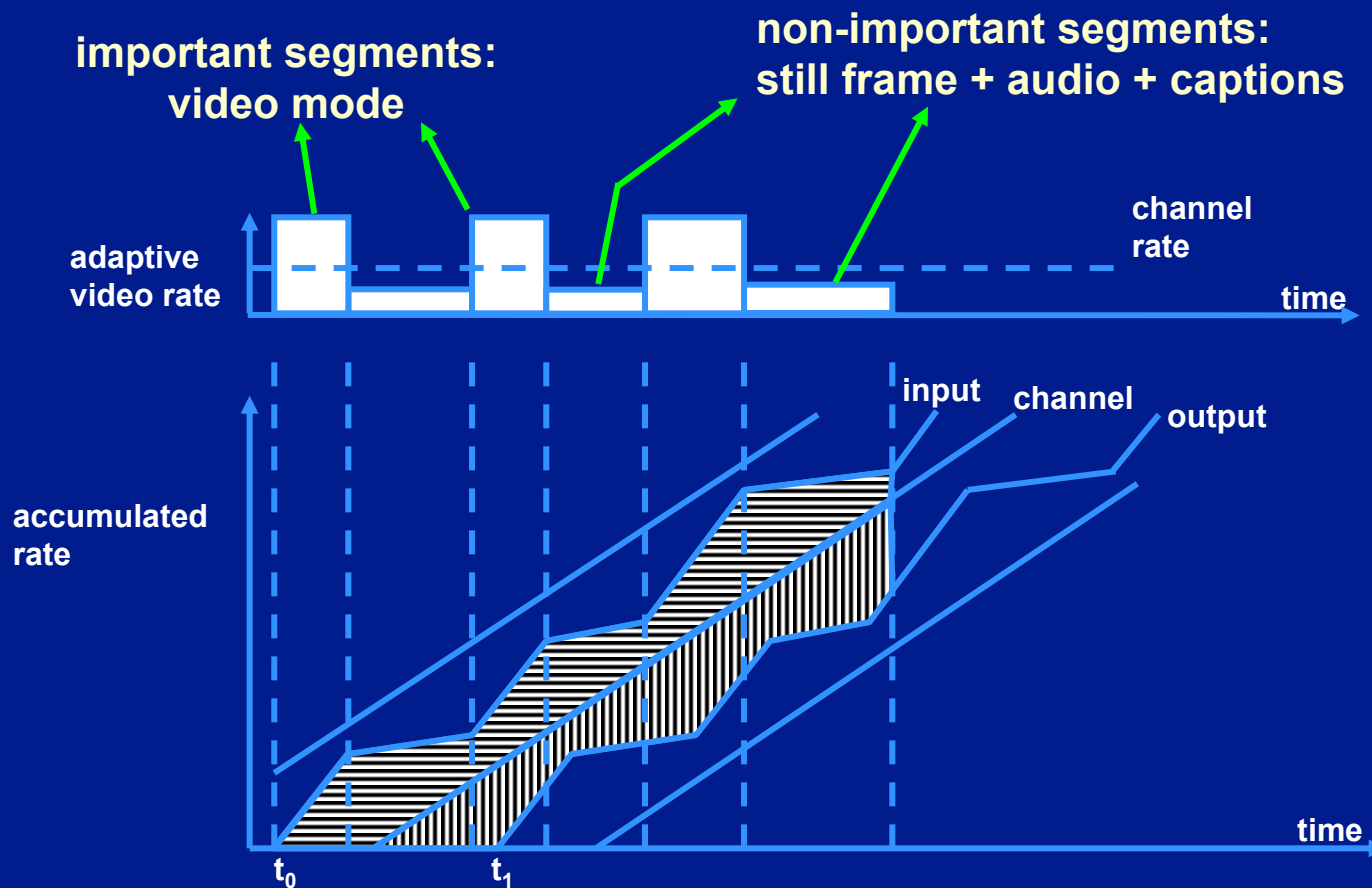

# Application: Time-Sensitive Mobile Video

## Content-based Adaptive Streaming

# Content Adaptive Streaming

# Application Constraints

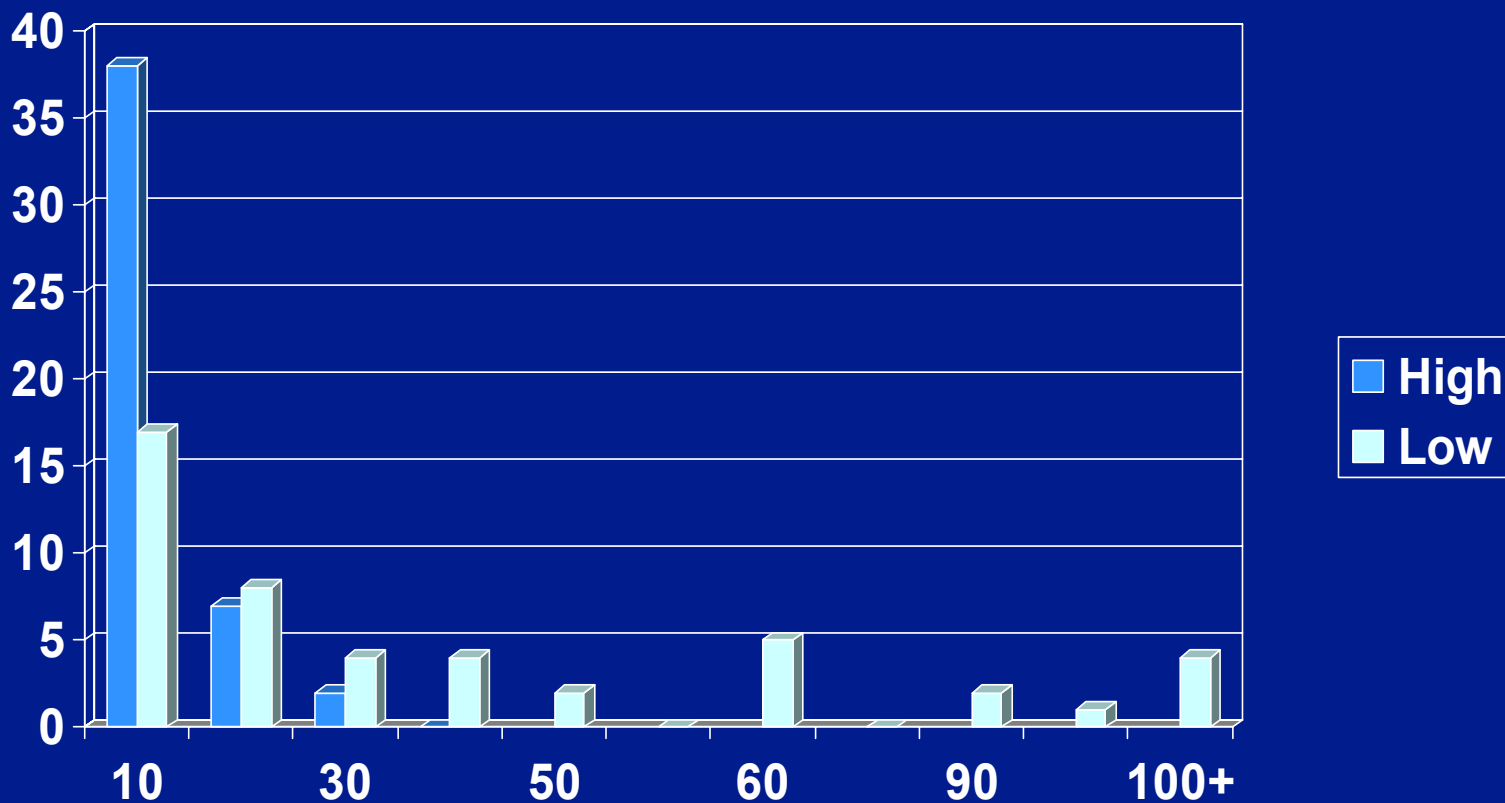

- **Buffer size: not a constraint**
  - 8MB buffer can store 2000 sec (32Kbps) - 250 sec (256Kbps)
- **Playback delay is the main constraint**
  - E.g., real-time event delivered in 60 sec
- **Client error more serious than server error**
  - Different handling policies
    - Degrade to Channel Rate vs. Freeze and resume

# Simulation Setup

- 2 full innings, concatenated
- No commercials
- 94 segments (47 h+l)
- Means(h,l)=7.05, 35.7
- Var(h,l)=1.44,2.4
- MaxL(h,l)=23,208
- Low rate = 0.2 \* channel rate, with a min. of 10 kbps
- Avg. rate = 0.9 \* channel rate  
i.e. utilization efficiency = 90%

# Content Distribution

# Server Underflow Rate

| <b>delay</b><br><b>avg rate</b> | <i>30 sec</i> | <i>60 sec</i> | <i>120 sec</i> | <i>240 sec</i> |
|---------------------------------|---------------|---------------|----------------|----------------|
| <b>300 kbps</b>                 | <b>6%</b>     | <b>6%</b>     | <b>6%</b>      | <b>4%</b>      |
| <b>128 kbps</b>                 | <b>6%</b>     | <b>6%</b>     | <b>6%</b>      | <b>4%</b>      |
| <b>64 kbps</b>                  | <b>6%</b>     | <b>6%</b>     | <b>6%</b>      | <b>4%</b>      |
| <b>32 kbps</b>                  | <b>6%</b>     | <b>6%</b>     | <b>6%</b>      | <b>3%</b>      |
| <b>16 kbps</b>                  | <b>13%</b>    | <b>6%</b>     | <b>4%</b>      | <b>1%</b>      |

# Client Underflow Rate

| <b>delay</b> \ <b>avg rate</b> | <i>30</i> | <i>60</i> | <i>120</i> | <i>240</i> |
|--------------------------------|-----------|-----------|------------|------------|
| <b>300</b>                     | 11        | 9         | 8          | 2          |
| <b>128</b>                     | 11        | 9         | 8          | 2          |
| <b>64</b>                      | 11        | 9         | 8          | 2          |
| <b>32</b>                      | 11        | 9         | 7          | 0          |
| <b>16</b>                      | 19        | 7         | 0          | 0          |

## Recurrent semantic units in soccer video?

- Game → a sequence of play and break segments
- Play/break → No canonical views/events
- Sporadic events (start and end)
- Shot boundary  $\neq$  play boundary

# Heuristic Model: Features → Views → Structure

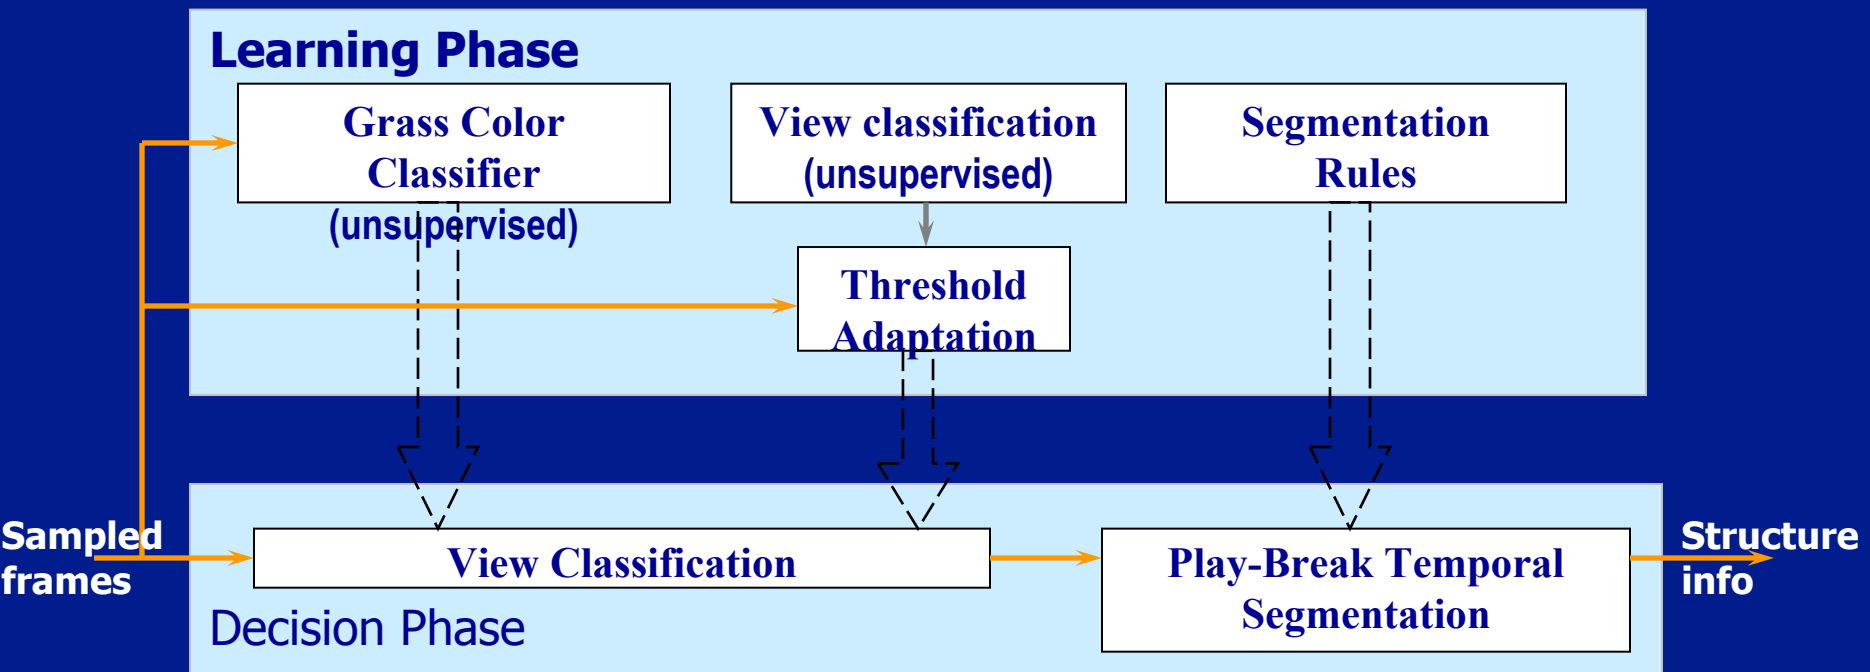

global

zoom-in

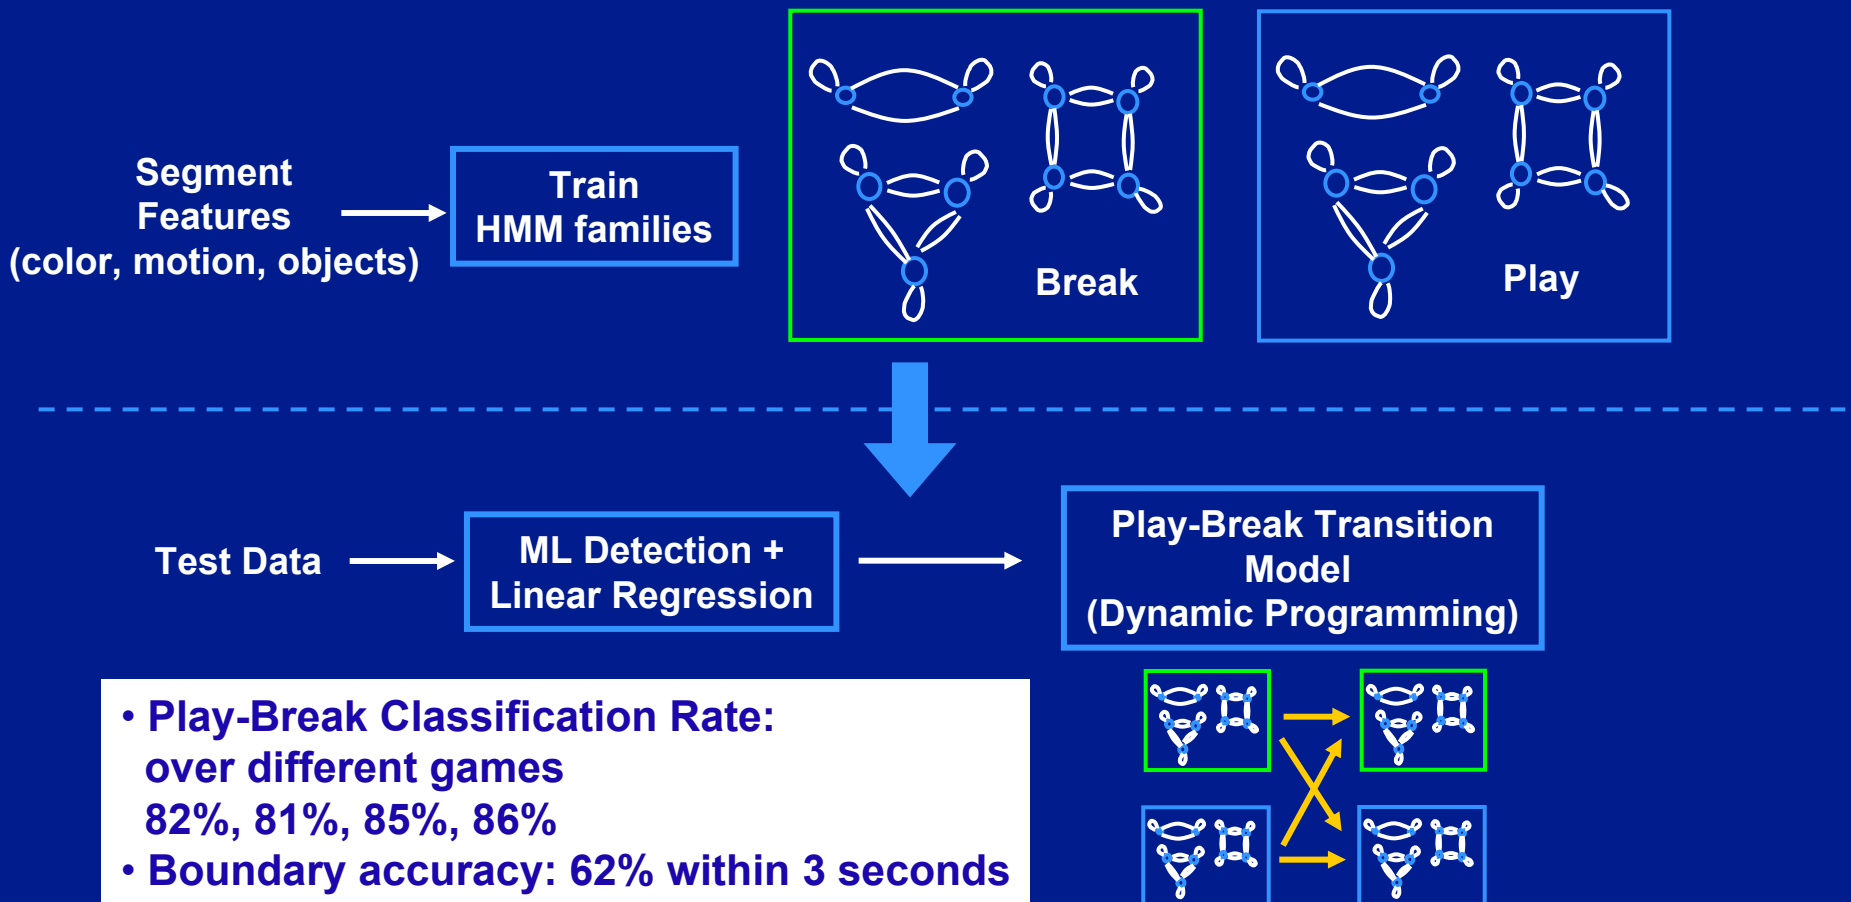

close-up

# Modeling Transitions with HMM

# Simple Event Detection

- **Baseball**
  - simple constraints to detect runs/hits after pitch
  - detection of camera motion and field
- **Tennis**
  - detect play types (net, base) and number of strokes
  - Extract and analyze player trajectory

# Detecting Player Behaviors

Tracking moving objects

|                          | # of Net Plays  | # of Strokes     |
|--------------------------|-----------------|------------------|
| <b>Ground Truth</b>      | <b>12</b>       | <b>221</b>       |
| <b>Correct Detection</b> | <b>11 (92%)</b> | <b>216 (97%)</b> |
| <b>False Detection</b>   | <b>7</b>        | <b>81</b>        |

# Conclusions

- A real time system for view detection and temporal structure parsing
  - multi-stage, multi-time-scale, frame + object level
  - compressed domain processing
  - systematic learning of domain rules
- Systematic method for extracting **Fundamental Semantic Units (FSU)**
- Promising application in “content-based adaptive streaming and real-time messaging”

# Current work

---

- **Integrate visual analysis with**
  - Video text recognition
  - Audio cue analysis
  - Speech and transcript analysis
- **Event Detection**
  - E.g., player, runs, goals

**END**
