
Extracting Information from Music Audio

Dan Ellis

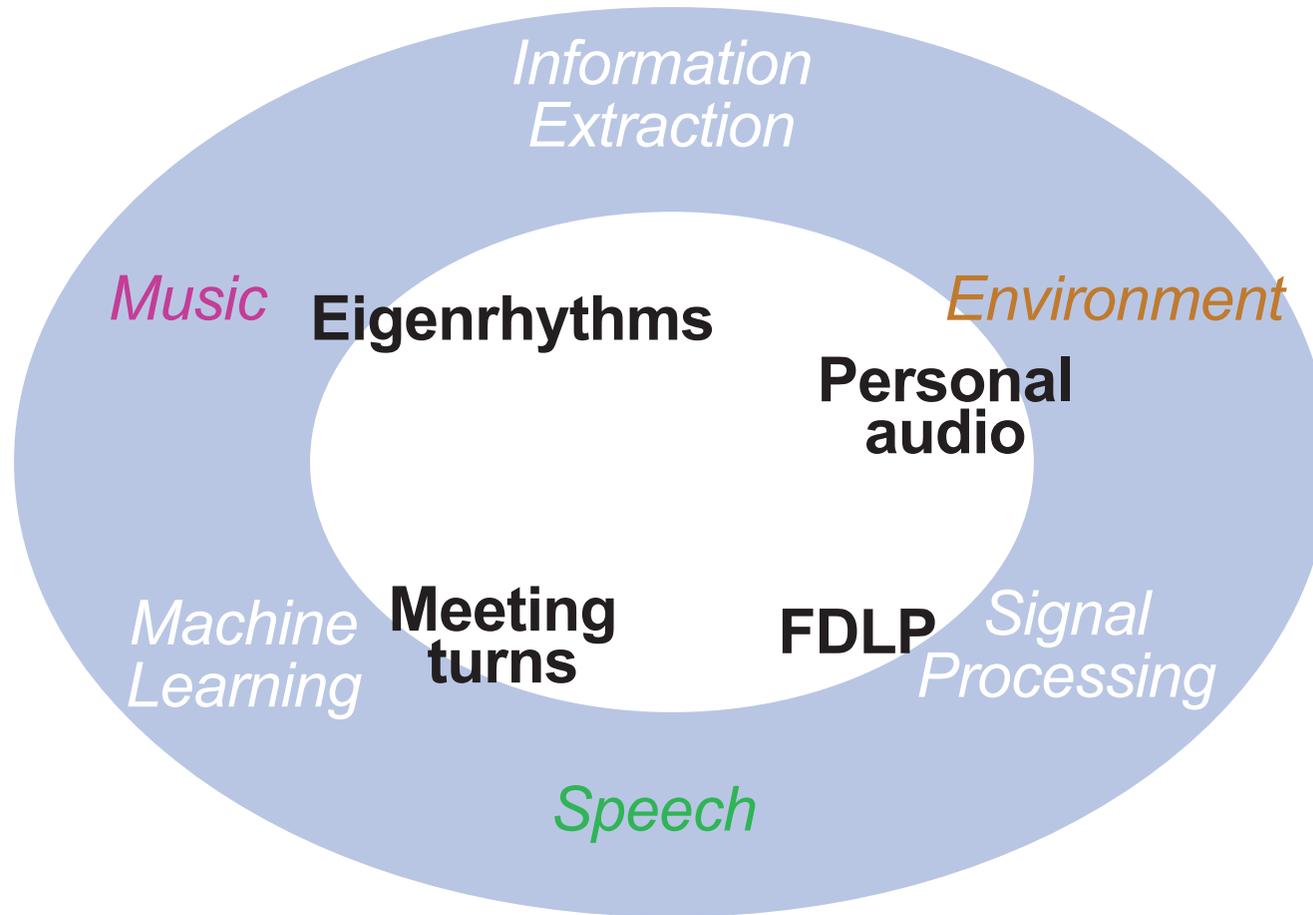

Laboratory for Recognition and Organization of Speech and Audio
Dept. Electrical Engineering, Columbia University, NY USA

<http://labrosa.ee.columbia.edu/>

1. Learning Music
2. Melody Extraction
3. Drum Pattern Modeling
4. Music Similarity

LabROSA Overview

I. Learning from Music

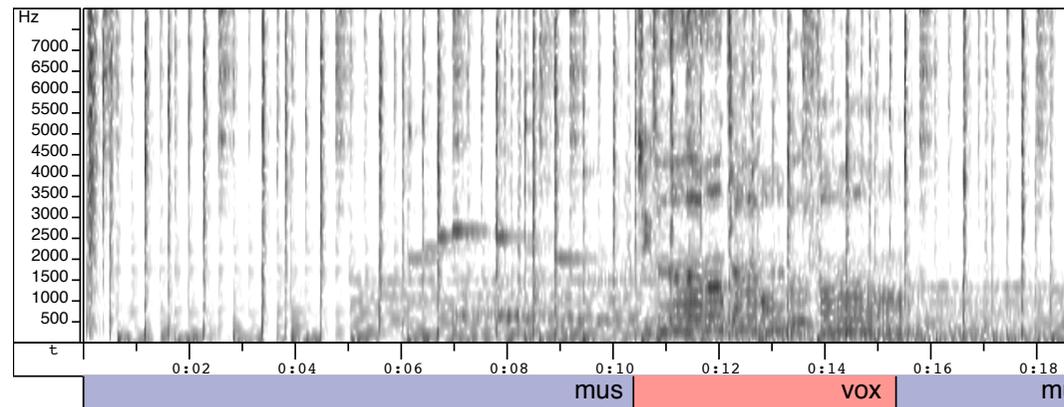

- A **lot** of music data available
 - e.g. 60G of MP3
 - ≈ **1000 hr** of audio, 15k tracks
- **What can we do with it?**
 - implicit **definition** of 'music'
- **Quality vs. quantity**
 - Speech recognition lesson:
 - 10x** data, **1/10th** annotation, **twice** as useful
- **Motivating Applications**
 - **music similarity** / classification
 - computer (assisted) music **generation**
 - **insight** into music

Ground Truth Data

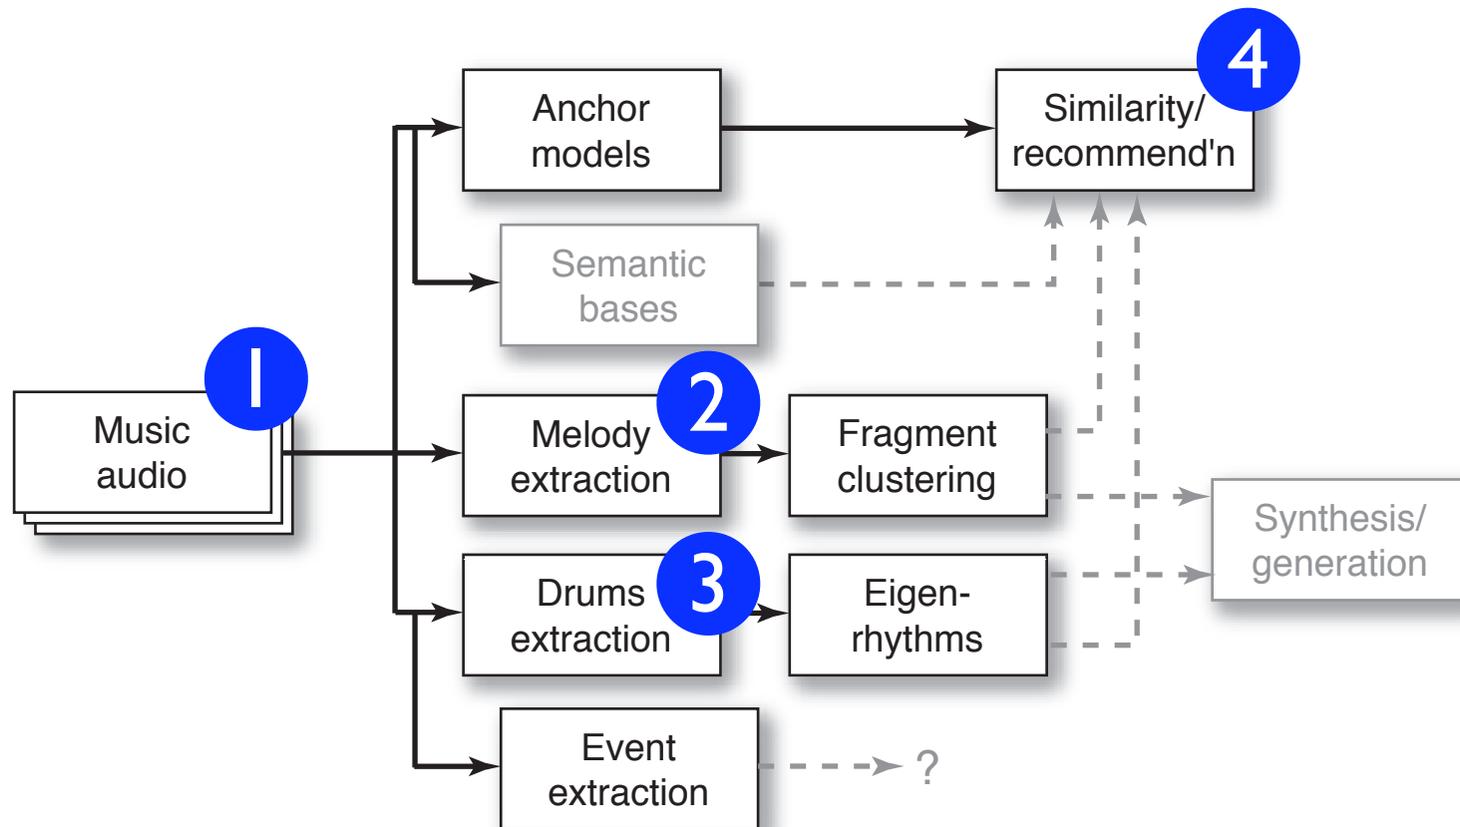

- A lot of **unlabeled** music data available
 - manual annotation is much rarer

File: /Users/dpwe/projects/aclass/aimee.wav

- **Unsupervised structure discovery possible**
 - .. but labels help to indicate what you want
- **Weak annotation sources**
 - artist-level descriptions
 - symbol sequences without timing (MIDI)
 - errorful transcripts
- **Evaluation requires ground truth**
 - limiting factor in Music IR evaluations?

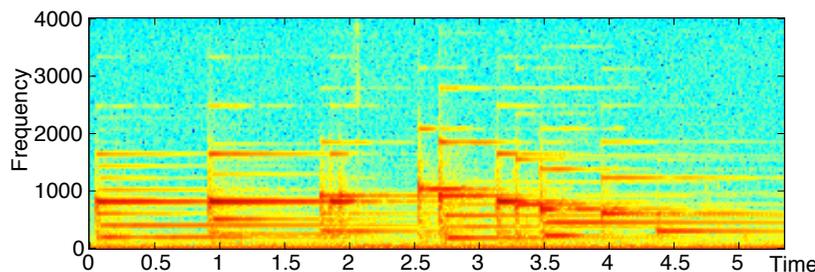

Talk Roadmap

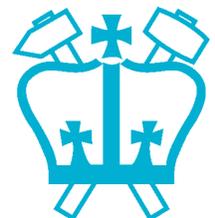

2. Melody Transcription

with Graham Poliner

- **Audio** → **Score** very desirable
 - for data compression, searching, learning
- **Full solution is elusive**
 - **signal separation** of overlapping voices
 - music constructed to frustrate!
- **Simplified problem:**
 - **“Dominant Melody”** at each time frame

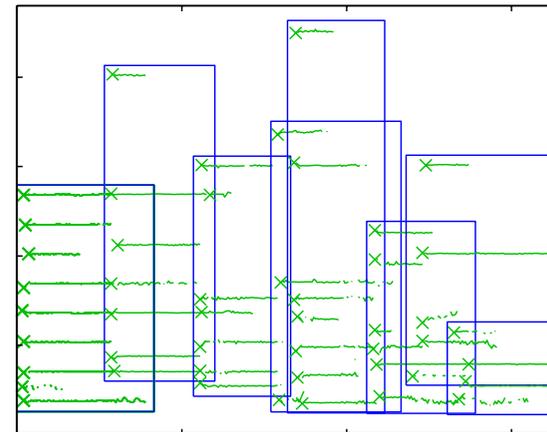

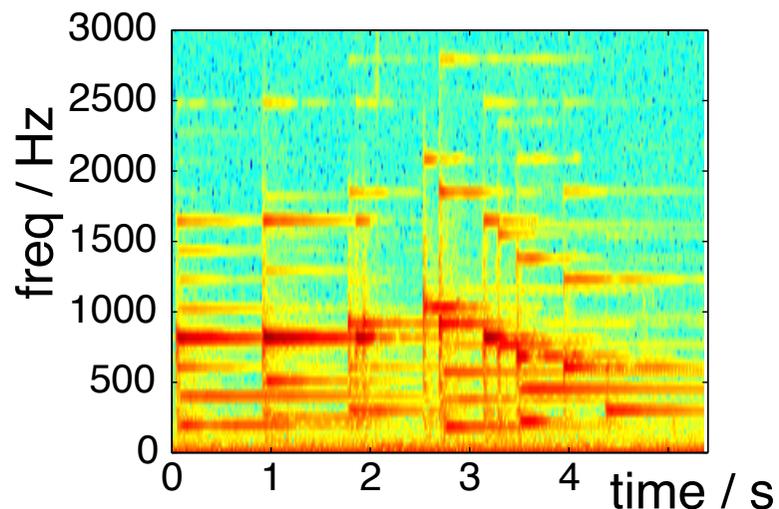

Aria

Conventional Transcription

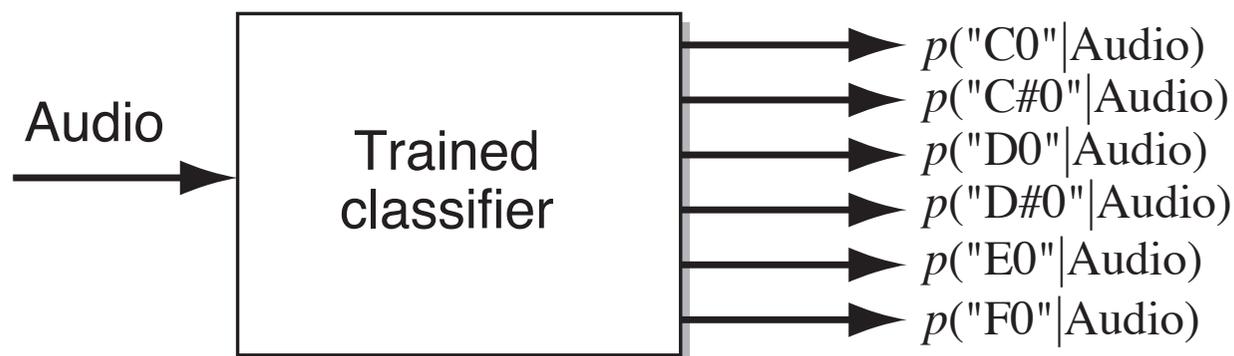

- Pitched notes have **harmonic** spectra
→ transcribe by searching for harmonics
 - e.g. **sinusoid modeling** + **grouping**

- **Explicit** expert-derived knowledge

Transcription as Classification

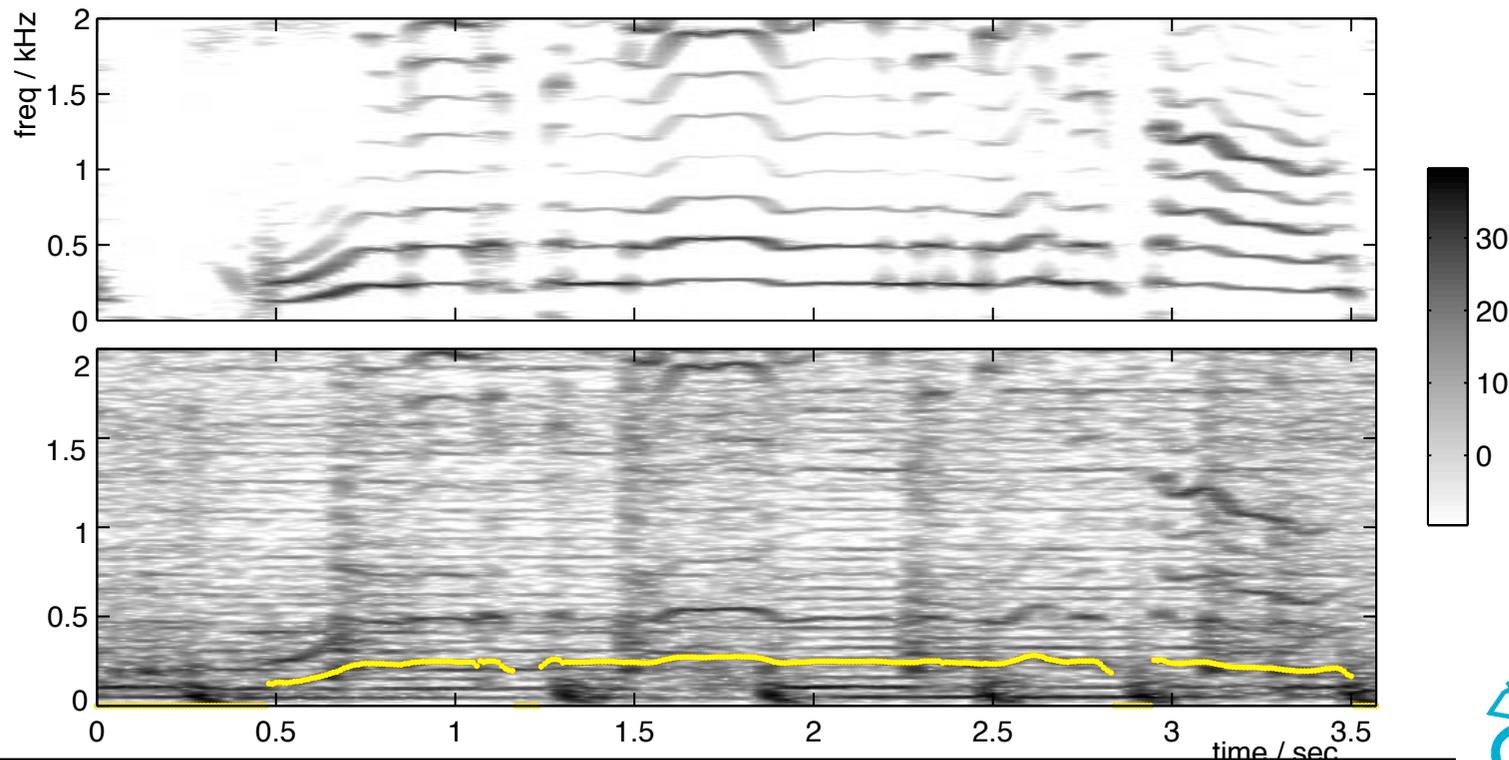

- **Signal models** typically used for transcription
 - harmonic spectrum, superposition
- **But ... trade domain knowledge for data**
 - transcription as **pure classification** problem:

- single N-way discrimination for “**melody**”
- per-note classifiers for polyphonic transcription

Training Data

- Need {data, label} pairs for classifier training
- Sources:
 - pre-mixing multitrack recordings + hand-labeling?
 - synthetic music (MIDI) + forced-alignment?

Melody Transcription Results

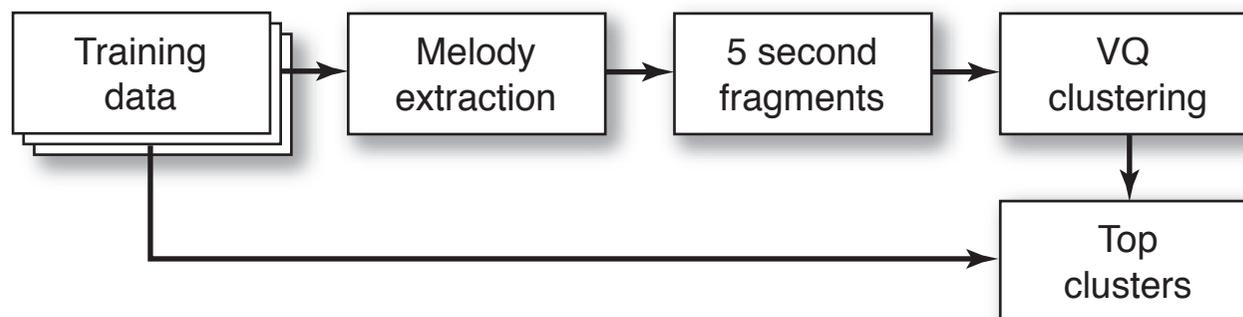

- Trained on 17 examples
 - .. plus transpositions out to +/- 6 semitones
 - SMO SVM (Weka)
- Tested on ISMIR MIREX 2005 set
 - includes foreground/background detection

Rank	Participant	Overall Accuracy	Voicing d'	Raw Pitch	Raw Chroma	Runtime / s
1	Dressler	71.4%	1.85	68.1%	71.4%	32
2	Ryynänen	64.3%	1.56	68.6%	74.1%	10970
3	Paiva 2	61.1%	1.22	58.5%	62.0%	45618
3	Poliner	61.1%	1.56	67.3%	73.4%	5471
5	Marolt	59.5%	1.06	60.1%	67.1%	12461
6	Paiva 1	57.8%	0.83	62.7%	66.7%	44312
7	Goto	49.9%*	0.59*	65.8%	71.8%	211
8	Vincent 1	47.9%*	0.23*	59.8%	67.6%	?
9	Vincent 2	46.4%*	0.86*	59.6%	71.1%	251
10	Brossier	3.2%* †	0.14 * †	3.9% †	8.1% †	41

○ Example...

Melody Clustering

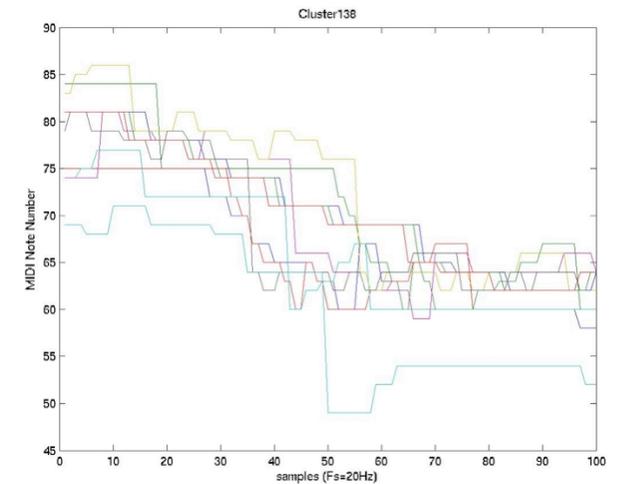

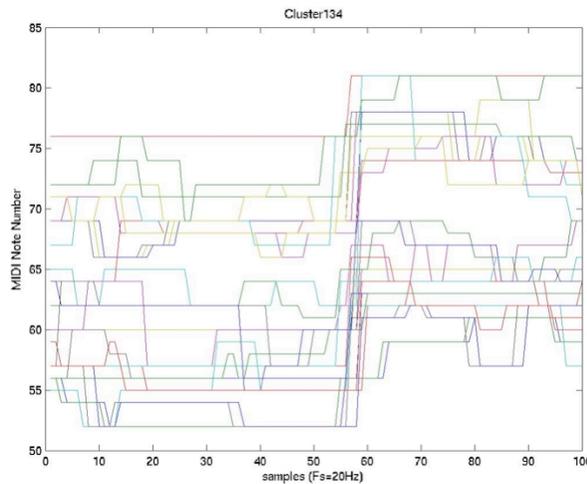

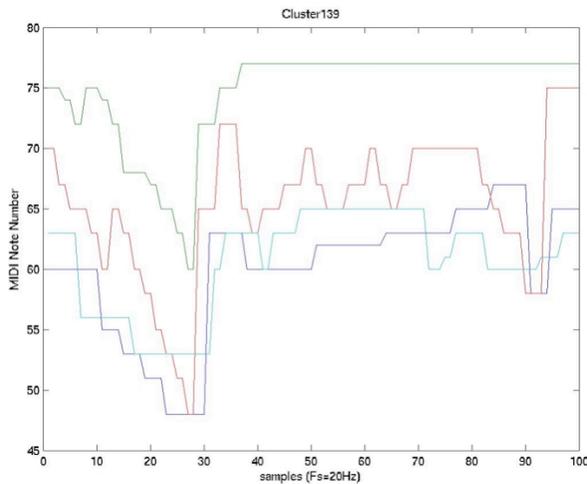

- Goal: Find ‘fragments’ that **recur** in melodies
 - .. across large music database
 - .. trade data for model sophistication

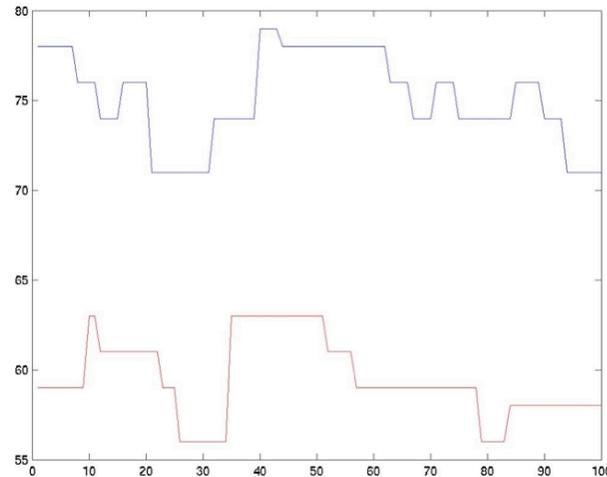

- Data sources
 - pitch tracker, or MIDI training data
- Melody fragment representation
 - $DCT(1:20)$ - removes average, smoothes detail

Melody clustering results

- Clusters match underlying contour:

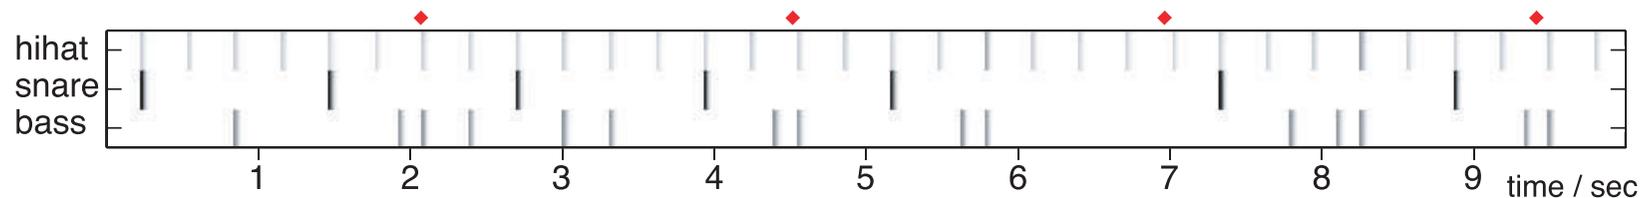

- Some interesting matches:
 - e.g. Pink + Nsync

3. Eigenrhythms: Drum Pattern Space

with John Arroyo

- Pop songs built on repeating “drum loop”
 - variations on a few bass, snare, hi-hat patterns

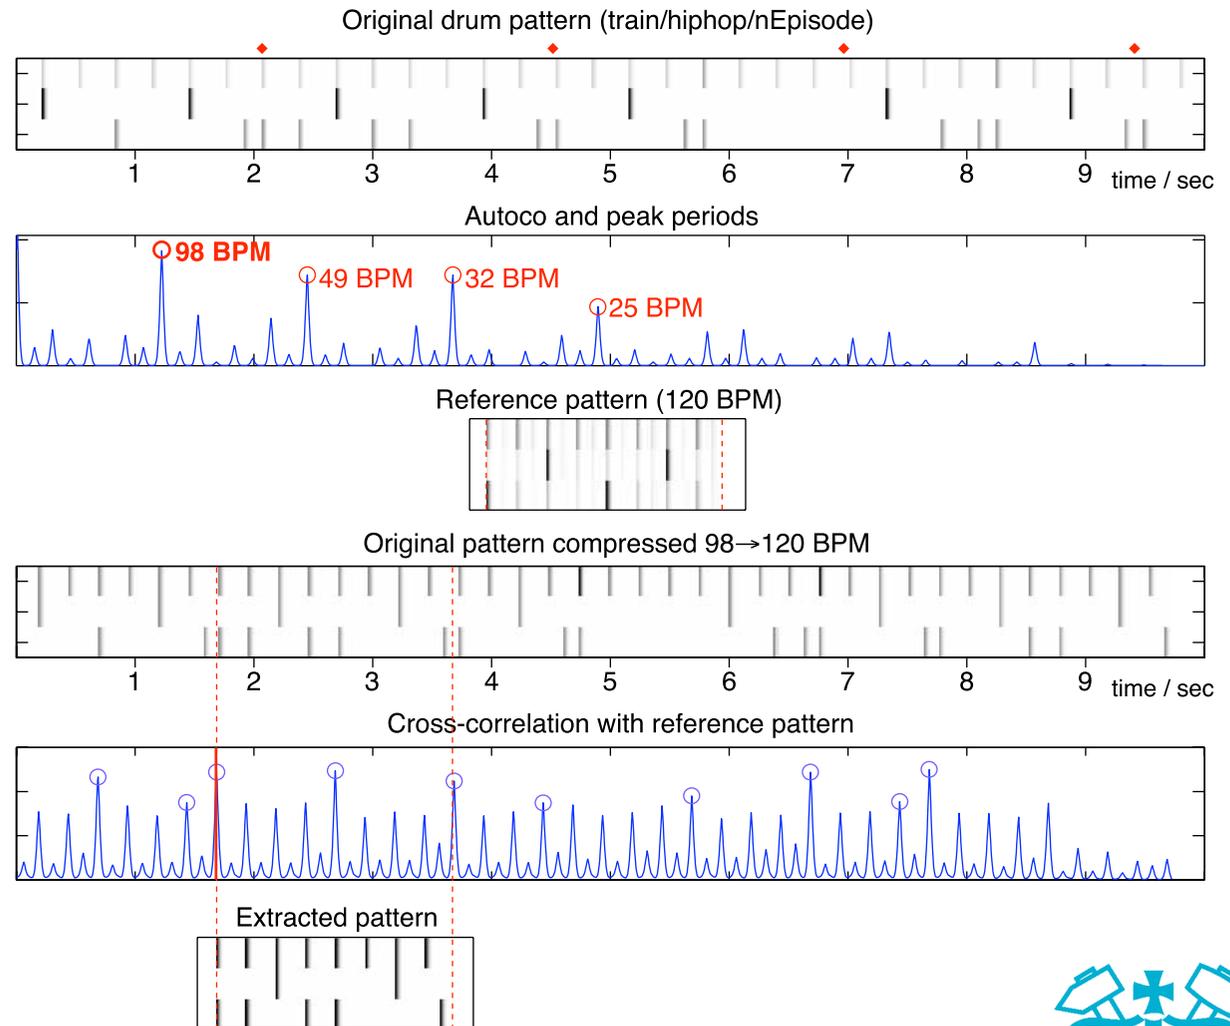

- **Eigen-analysis** (or ...) to capture variations?
 - by analyzing lots of (MIDI) data, or from audio
- **Applications**
 - music categorization
 - “beat box” synthesis
 - insight

Aligning the Data

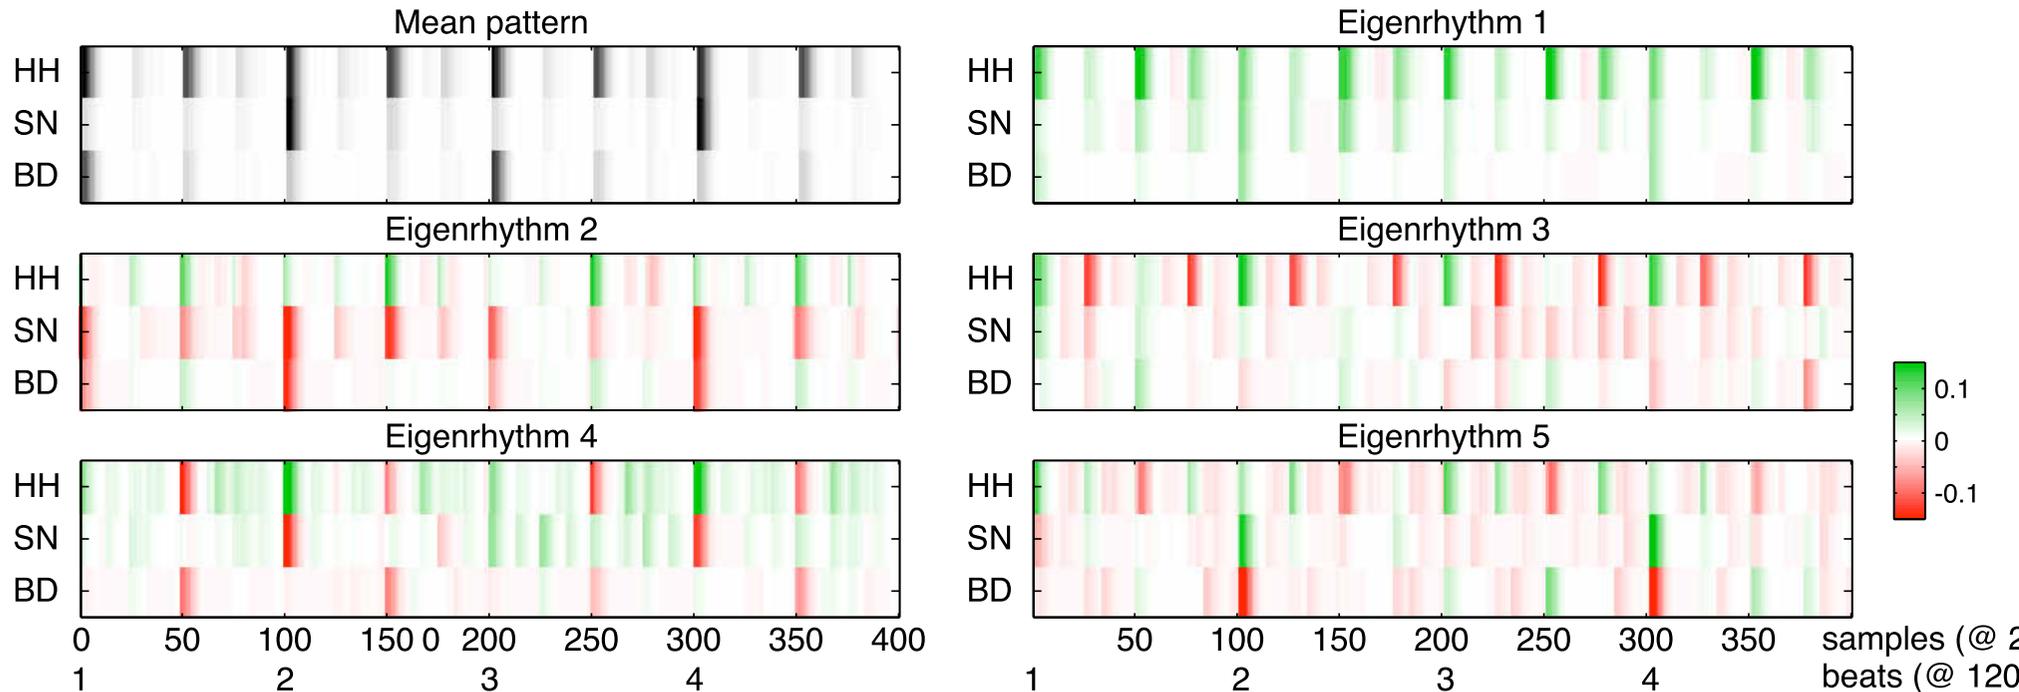

- Need to **align** patterns prior to modeling...

tempo (stretch):
by inferring BPM &
normalizing

downbeat (shift):
correlate against
'mean' template

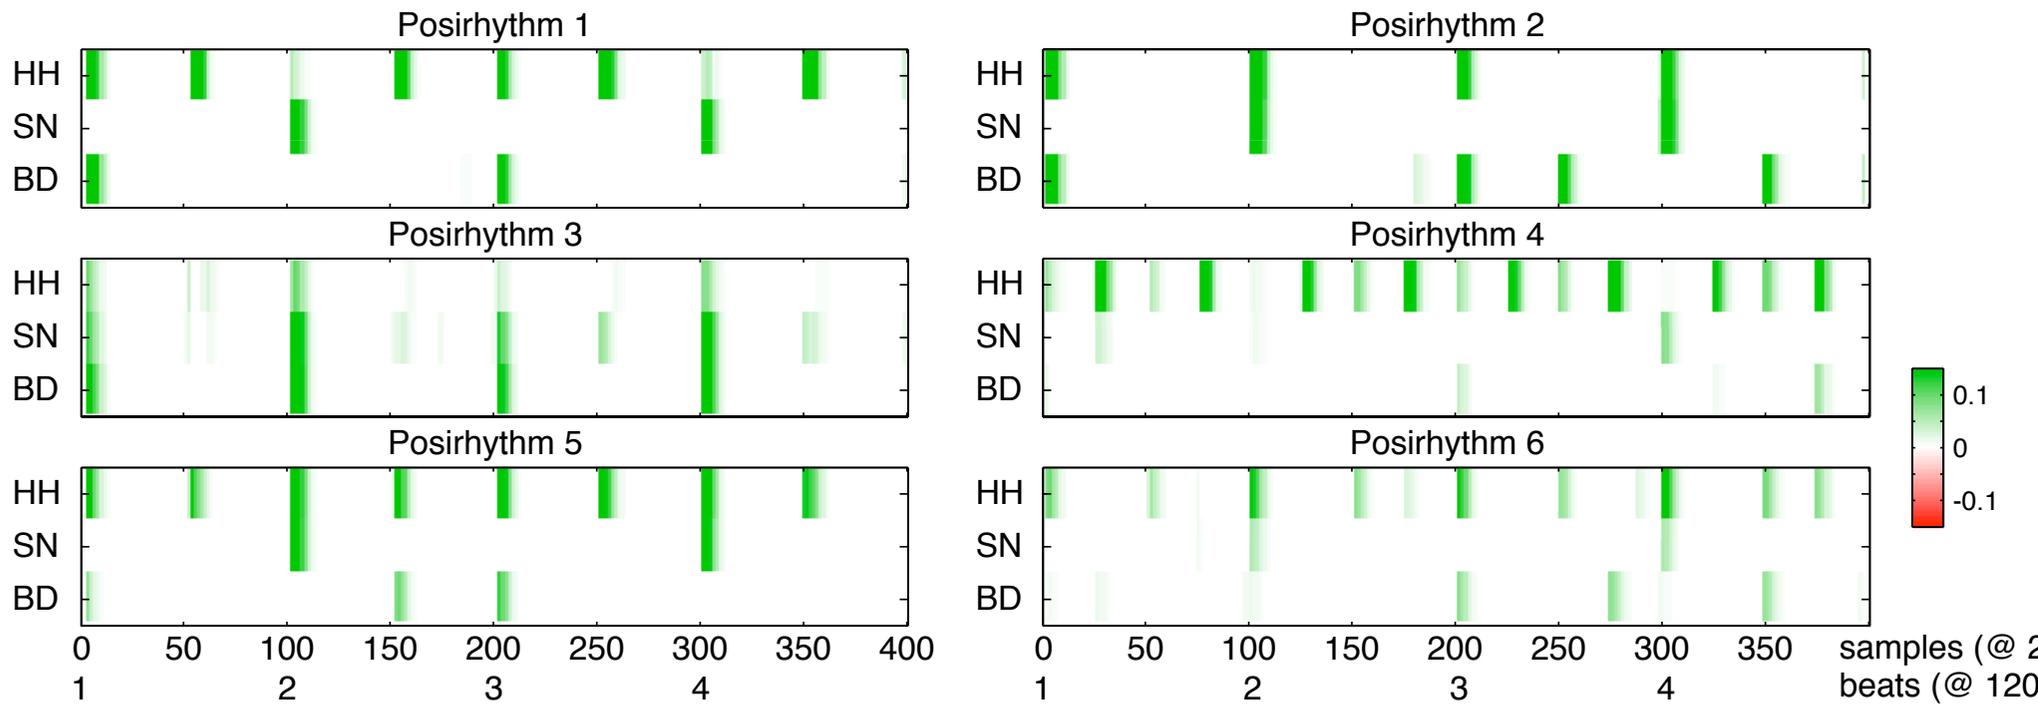

Eigenrhythms (PCA)

- Need 20+ Eigenvectors for good coverage of 100 training patterns (1200 dims)
- Eigenrhythms both **add** and **subtract**

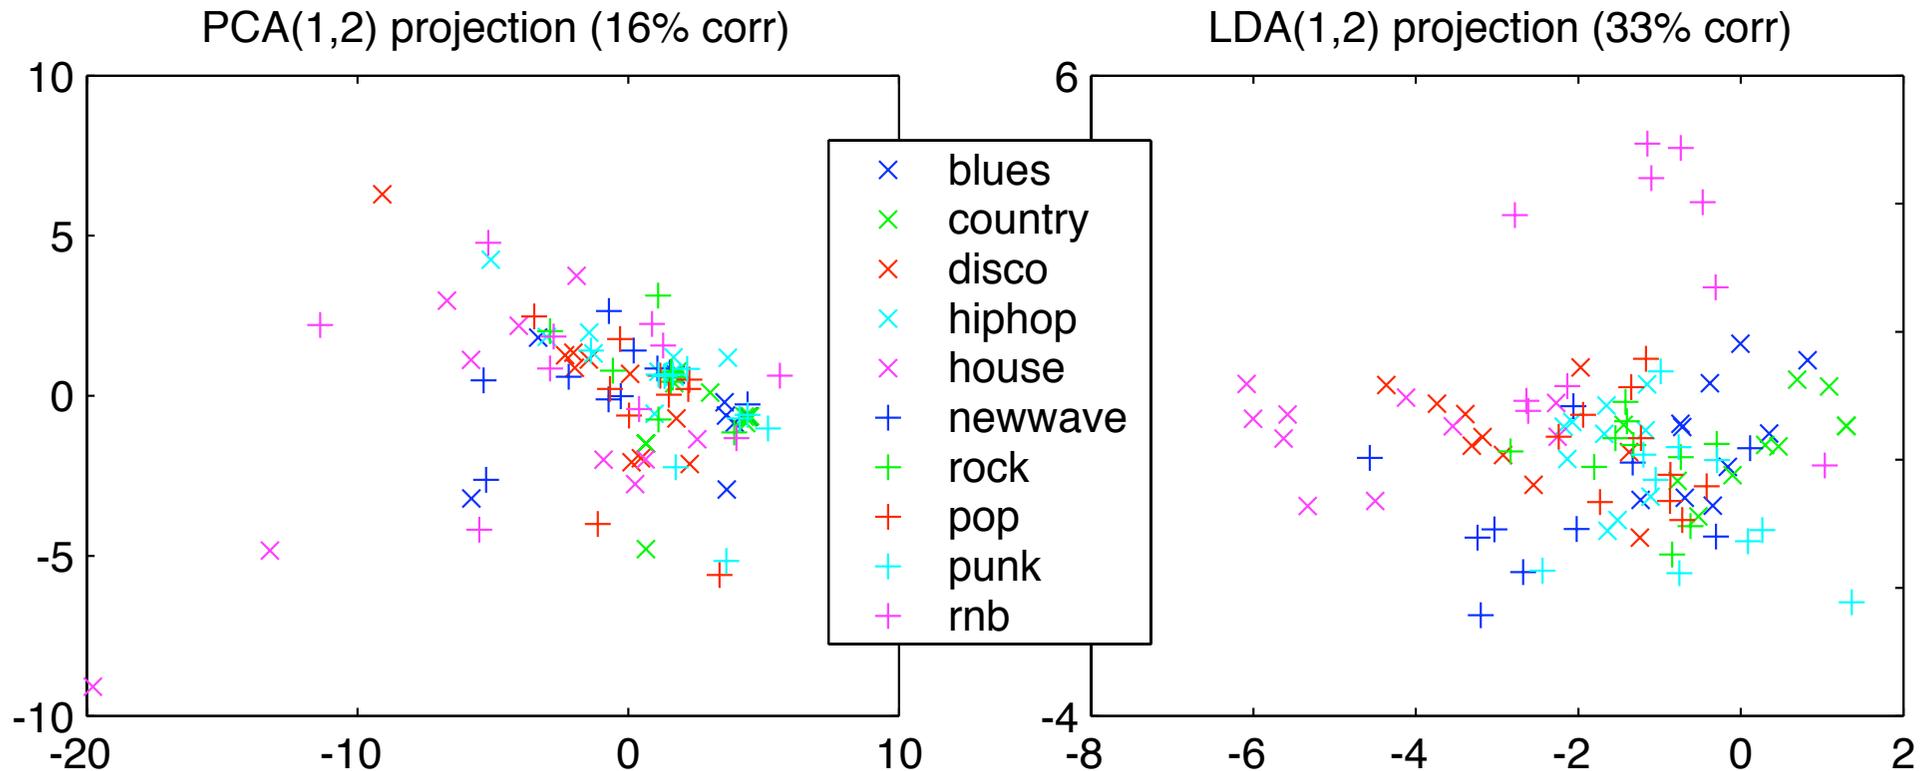

Posirhythms (NMF)

- Nonnegative: only adds beat-weight
- Capturing some structure

Eigenrhythms for Classification

- **Projections in Eigenspace / LDA space**

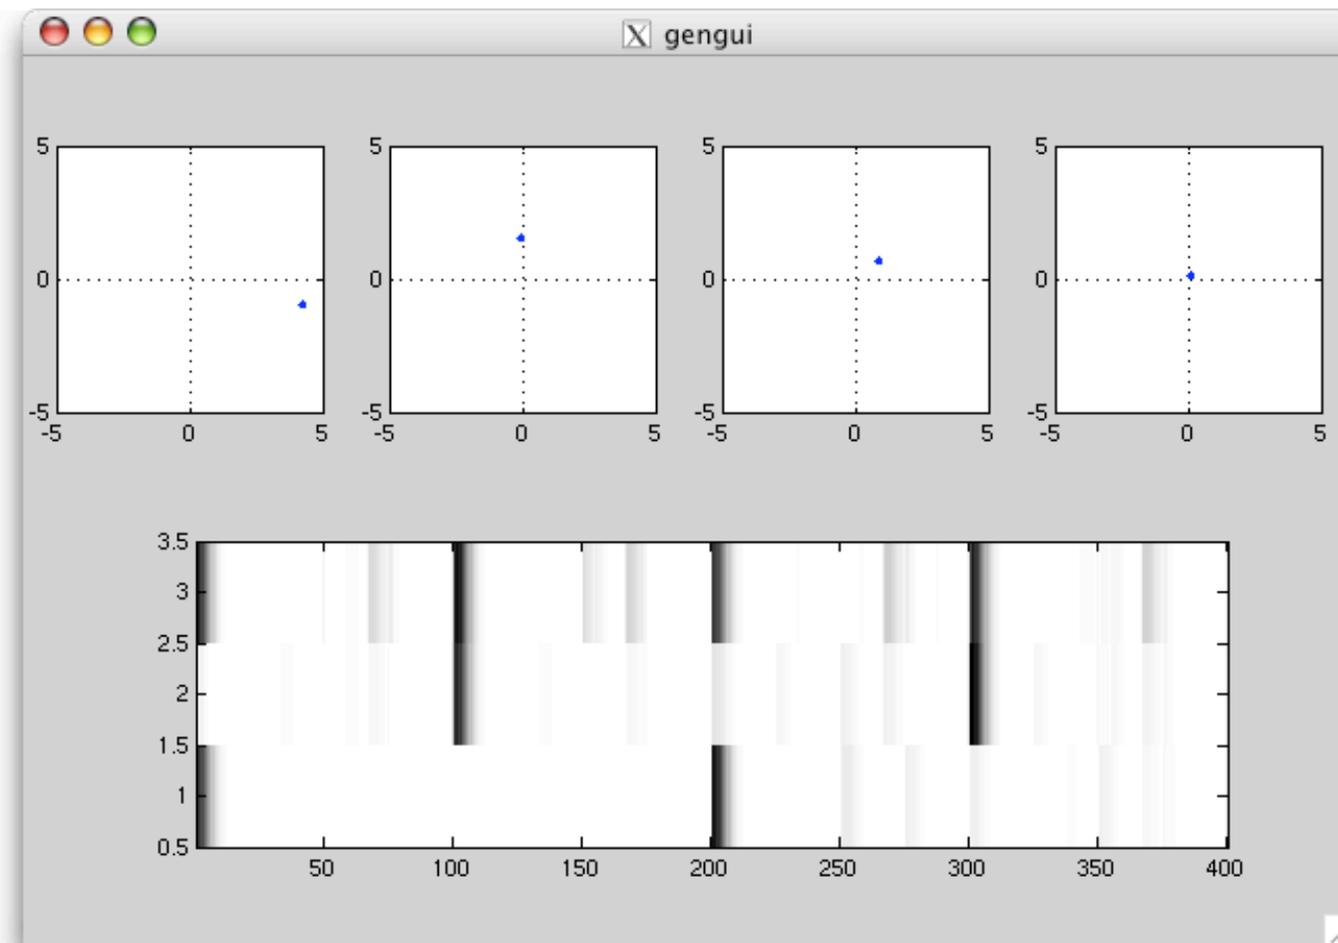

- **10-way Genre classification (nearest nbr):**

- PCA3: 20% correct

- LDA4: 36% correct

Eigenrhythm BeatBox

- Resynthesize rhythms from eigen-space

4. Music Similarity

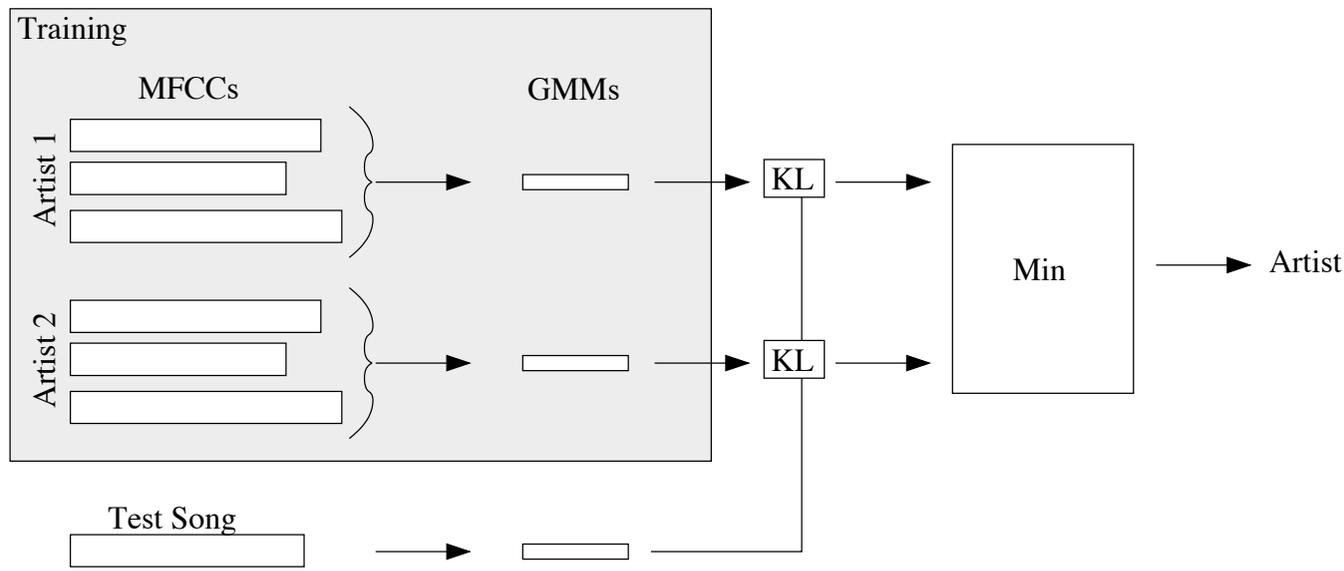

with Mike Mandel
and Adam Berenzweig

- Can we predict which songs “**sound alike**” to a listener?
 - .. based on the audio waveforms?
 - many aspects to **subjective** similarity
- **Applications**
 - query-by-example
 - automatic **playlist** generation
 - discovering **new music**
- **Problems**
 - the right **representation**
 - modeling **individual** similarity

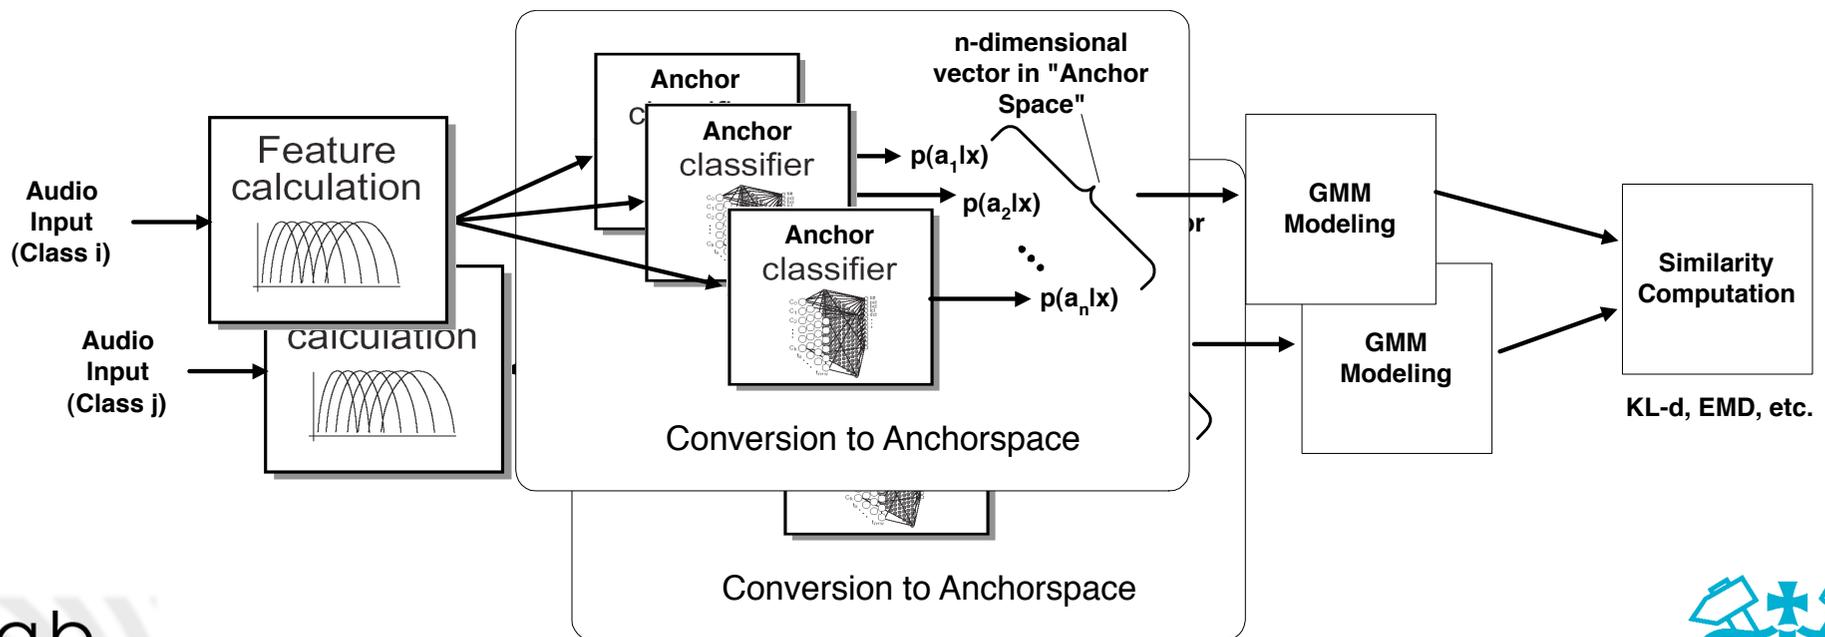

Timbral Music Similarity

- Measure similarity of **feature distribution**
 - i.e. collapse across time to get **density** $p(x_i)$
 - compare by e.g. KL divergence
- e.g. **Artist Identification**
 - learn **artist model** $p(x_i | \text{artist } X)$ (e.g. as **GMM**)
 - classify unknown song to closest model

“Anchor Space”

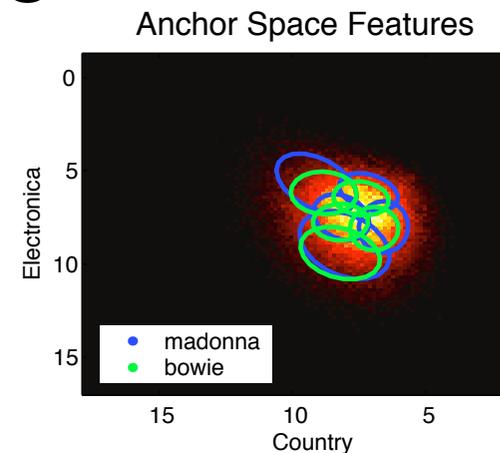

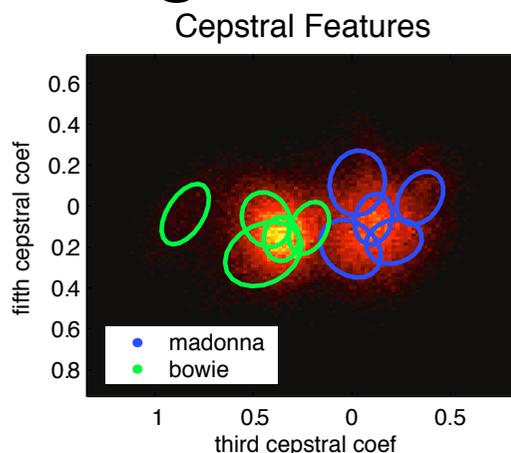

- Acoustic features describe each song
 - .. but from a **signal**, not a **perceptual**, perspective
 - .. and not the **differences** between songs
- Use **genre classifiers** to define new space
 - prototype genres are “anchors”

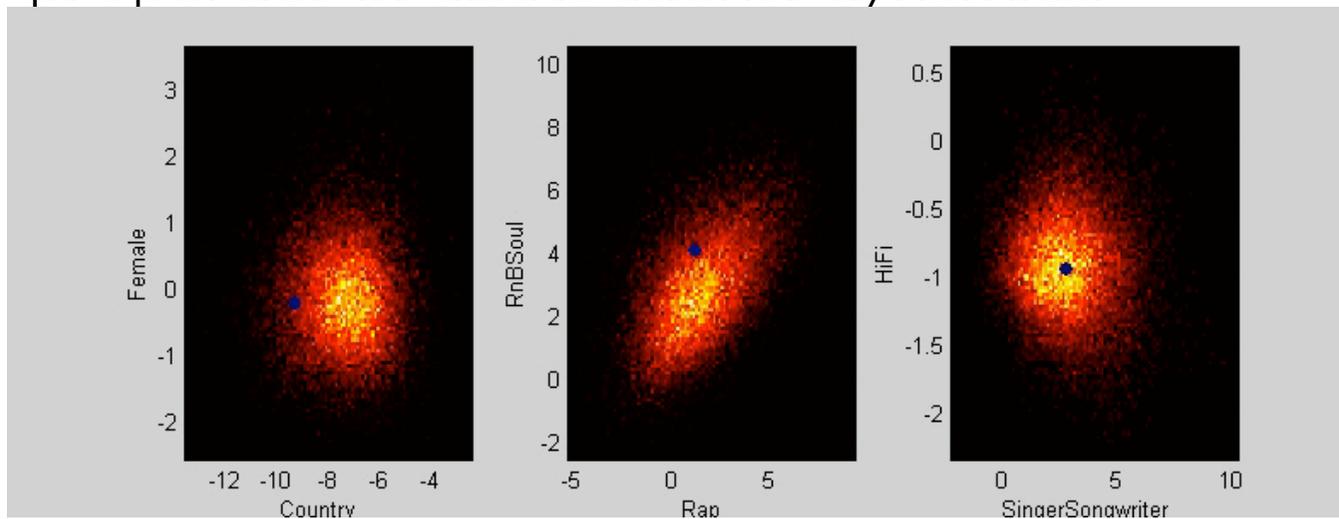

Anchor Space

- Frame-by-frame high-level categorizations

- compare to raw features?

- properties in distributions? dynamics?

Ground-truth data

- Hard to evaluate Playola's 'accuracy'
 - user tests...
 - ground truth?
- “Musicseer” online survey:
 - ran for 9 months in 2002
 - > 1,000 users, > 20k judgments
 - <http://labrosa.ee.columbia.edu/projects/musicsim/>

Which artist is most similar to:
Janet Jackson?

1. [R. Kelly](#)
2. [Paula Abdul](#)
3. [Aaliyah](#)
4. [Milli Vanilli](#)
5. [En Vogue](#)
6. [Kansas](#)
7. [Garbage](#)
8. [Pink](#)
9. [Christina Aguilera](#)

Evaluation

- Compare Classifier measures against Musicseer subjective results

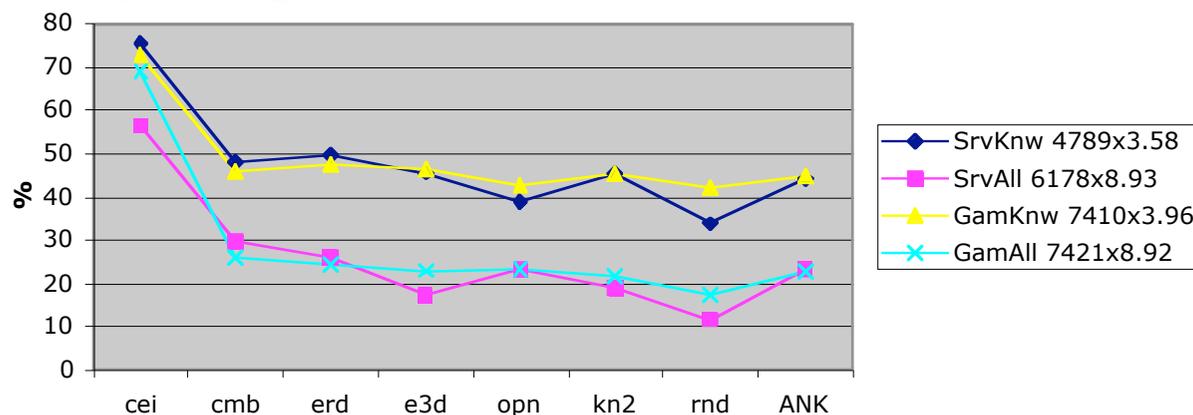

- “triplet” agreement percentage

- Top-N ranking agreement score:

$$s_i = \sum_{r=1}^N \alpha_r^r \alpha_c^{k_r} \quad \alpha_r = \left(\frac{1}{2}\right)^{\frac{1}{3}} \quad \alpha_c = \alpha_r^2$$

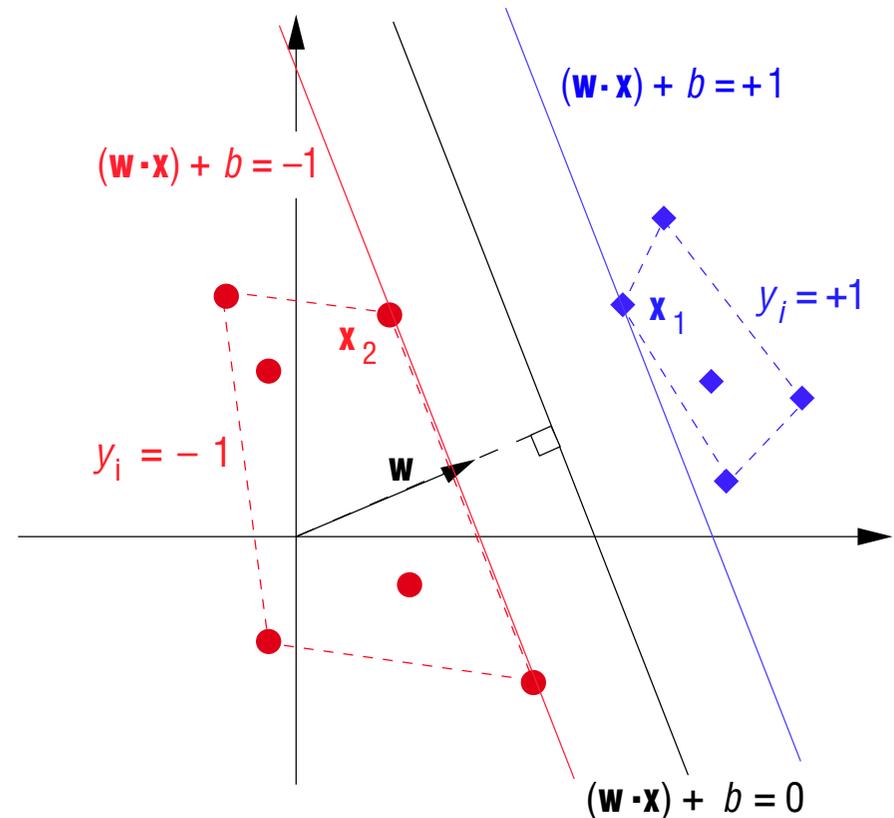

- First-place agreement percentage

- simple significance test

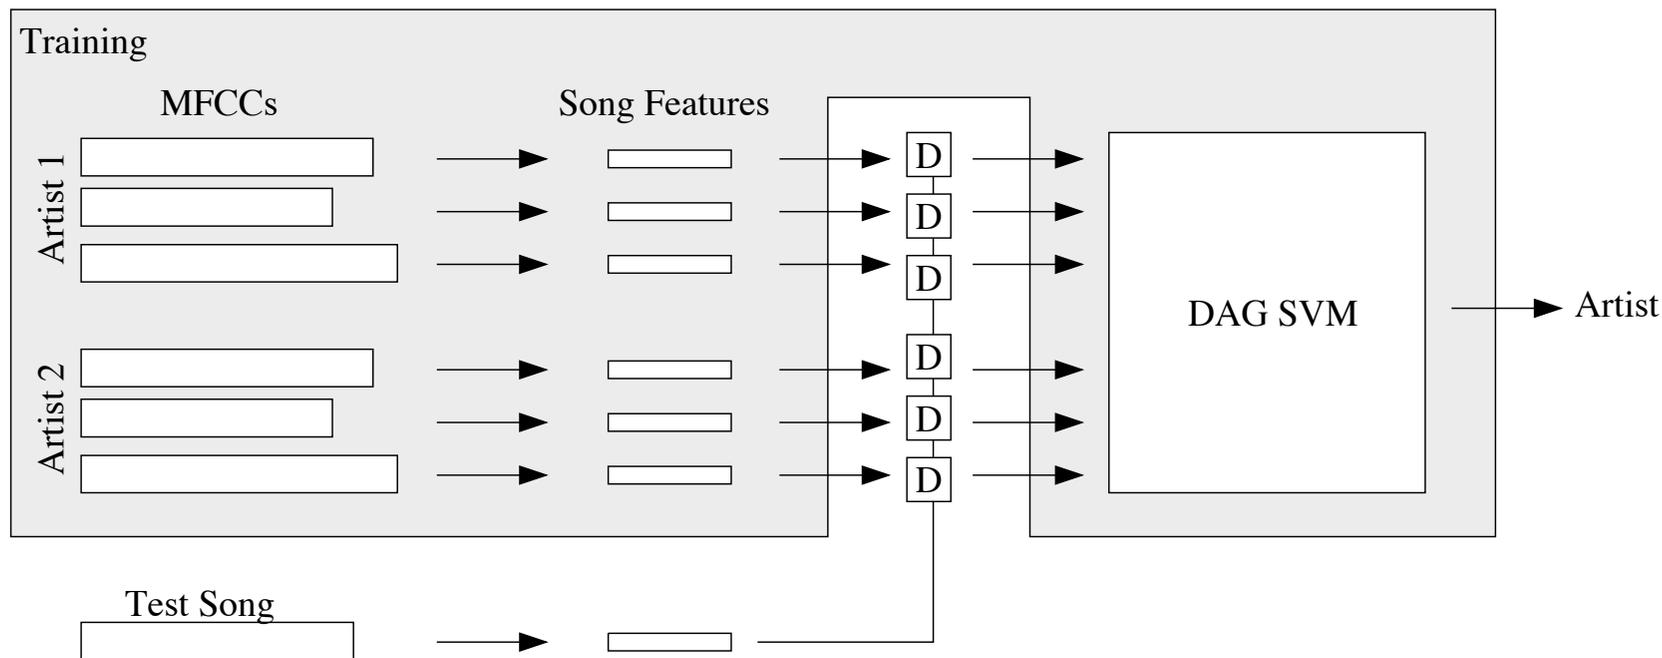

Using SVMs for Artist ID

- Support Vector Machines (**SVMs**) find hyperplanes in a high-dimensional space
 - relies only on matrix of distances between points
 - much 'smarter' than nearest-neighbor/overlap
 - want diversity of reference vectors...

Song-Level SVM Artist ID

- Instead of **one model per artist/genre**,
use every training **song** as an ‘anchor’
 - then SVM finds best support for each **artist**

Artist ID Results

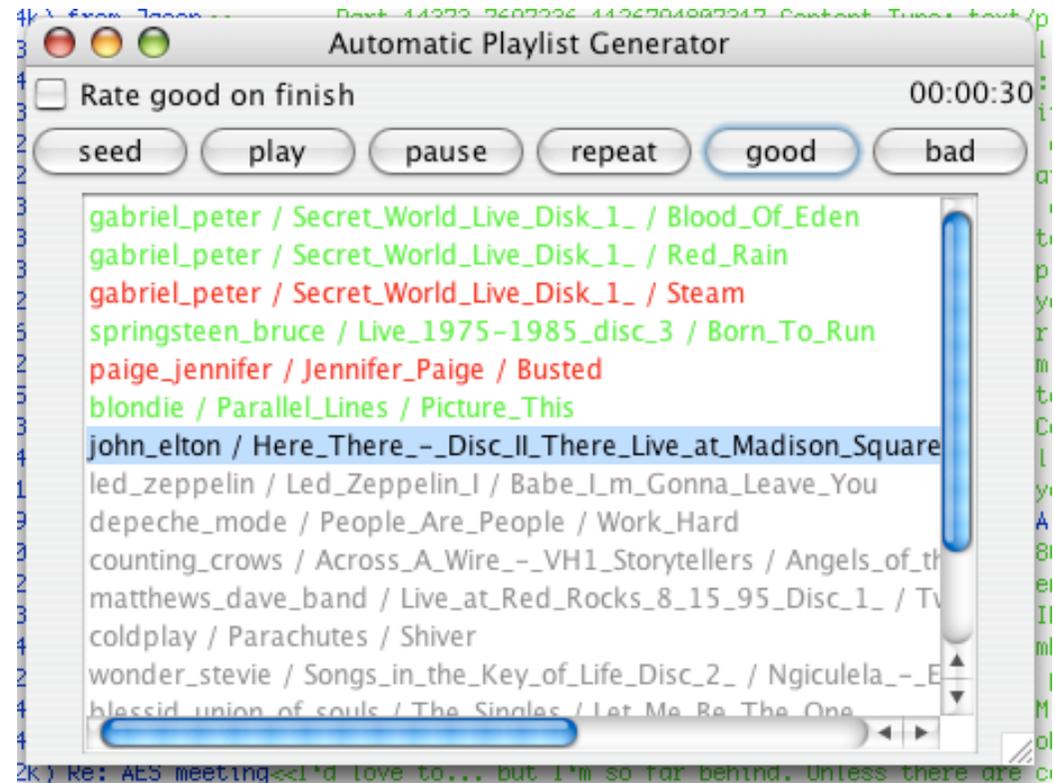

- ISMIR/MIREX 2005 also evaluated **Artist ID**
- **148 artists, 1800 files** (split train/test) from 'uspop2002'
- Song-level SVM clearly **dominates**
 - using only MFCCs!

MIREX 05 Audio Artist (USPOP2002)

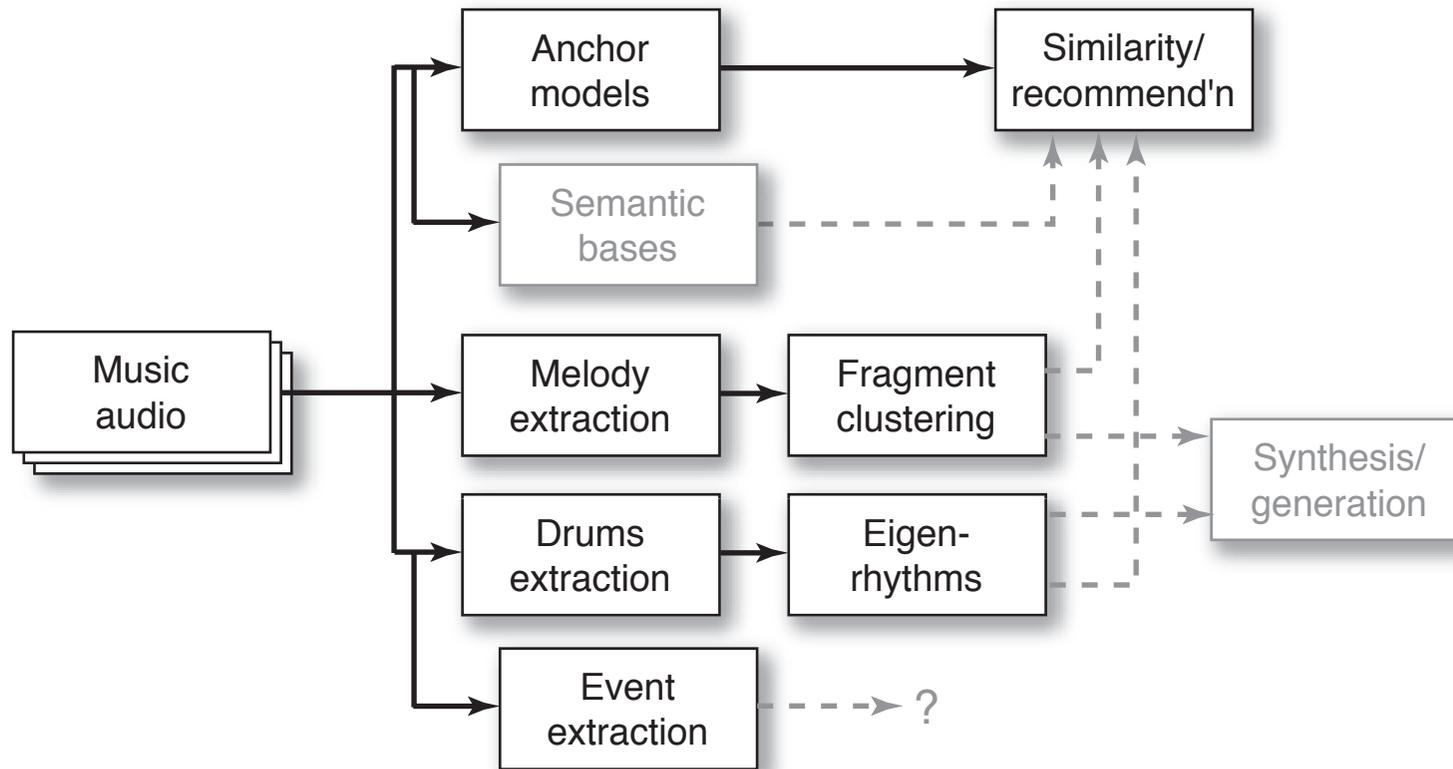

Rank	Participant	Raw Accuracy	Normalized	Runtime / s
1	Mandel	68.3%	68.0%	10240
2	Bergstra	59.9%	60.9%	86400
3	Pampalk	56.2%	56.0%	4321
4	West	41.0%	41.0%	26871
5	Tzanetakis	28.6%	28.5%	2443
6	Logan	14.8%	14.8%	?
7	Lidy	Did not complete		

Playlist Generation

- SVMs are well suited to “active learning”
 - solicit labels on items closest to current boundary
- Automatic player with “skip”
 - = Ground truth data collection
 - active-SVM
 - automatic playlist generation

Conclusions

- Lots of **data**
+ noisy **transcription**
+ weak **clustering**
⇒ musical **insights?**
